With the 2.5 watts my little HT puts out, I get into some of the
repeaters in the area marginaly, others not at all. With the 5 watt
pack, I get into most of them full-quieting, some of them marginaly.
I comply with part 97 in this respect.

When it comes to simplex use, it's a different story. With my Gp-9, I
can use the 30mw setting and make contacts in Mesa which is 30 miles
away. So my "KH2PZ incorrect" 2.5-5 watts is not necessary.
And to get right to it, there is no provision given, with respect to
the rule you mention, on any of these commercially available HTs to
comply. Think about it, if your power is adjusted in steps, and you
can operate with a lower output then that povided by the radio's
settings, are you in violation or not? It says minimum power
necessary, not minimum power setting on the radio.
And one other thing, I don't know what rock you live on, and whether
or not you have to deal with intermod, but squelch'es are used at a
high setting here in Metro Phoenix.

Don't make any assumptions as to my operating practices or proceedures, as I will (or would) not make any of yours. But it seems that when you are presented with reasonable debate, you resort to attacking the person and not the subject matter. Frankly, that in itself is not amateur like.

You mentioned part 97 at the end of your last post, mixed with the subject we *were* discussing. It appeared to me that you were implying that this EPA crap (which is now also part of 97) was the basis for you advising that HTs be held at arms length at minimum power. Thus accepting the regulation as being valid and worthwhile. I obviously disagree.

If you want to keep debating the issue, that's fine. But keep it on the level of subject and not assumptions. Ok?

Hi ...

The Baycom is cute but you will find that a real TNC is the ticket
after a bit. I ran a Baycom (externally powered with a 9 volt battery)
with my HP100LX for a bit.

I would suggest you consider the tiny TNC made by Pacomm out of
Florida. It is a full TNC, with KISS, mailbox, etc. As such, it a
lot easier to program for. Any TNC will drive it. I have used Procomm
(for DOS) on the 100 with good sucess. I have since changed to a
small terminal that comes packaged with the MSYS BBS software. Its
in one of the three distribution disks at coffman.csuohio.edu. MSYS
itself can be used on the 100LX and provides K-node, network node,
TCP/IP (of sorts, IPers crab about it) ... its a full BBS. You have
to read the manual a few times and know something about memory to get
it to run right. That seems to clash with the plug-and-play people,

Hmmm, strange, 2.5 to 5 watts is only 3db. 3db is only 1/2 an S unit,
certainly not much if any practical difference.

==============================================
To all Electronics Companies, Service Person-
nel, Webmasters & Hobbyists,

I am preparing a book tentatively titled "Sam's
Internet Guide to the Electronics Industry", to
be published by Howard W. Sams & Co. and PROMPT
Publications. The book will contain site add-
resses for electronics resources. Companies,
organizations and individual web creators are
encouraged to fill out a simple FORM at the ad-
dress below.
-----------------------------------------------
http://web.idirect.com/~ifx/book/
-----------------------------------------------
In addition, any electronics related addresses
or resources you run into while surfing please
let me know by filling out said form.

If you lack FORMS capability send an email with
the info below. I am especially interested in
sites offering simple electronics repair data,
service specs and hobbyist help-pages. Other
resources are more than welcome. Top Urls will
be printed in this directory and updated in
future issues.

4418. Data Radio Stand Test Methods Web Page

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-08-20 00:00:00 UTC
From: burt lang <burt@rocler.qc.ca>
Message-ID: <321968BB.6BF4@rocler.qc.ca>
Source record: 35114

This is to announce the opening of a Web Site devoted to establishing a Standard Set of Test Methods for testing radios intended for data service.

http://www.rocler.qc.ca/burt/

The Data Radio Standard Test Methods project was started some 2 years ago and was presented at the 14th ARRL Digital Communications Conference in Texas in Sept 95. At the conference it was received with great interest. The proposed test method documents were finished and sent to selected organizations for review at the beginning of this year. I have now completed the transfer to the Web.

Warning: The documents are quite technical and don't have glitzy graphics or animation. Nor is the site just a bunch of links to other sites. It is just pure original technical documentation.

I welcome comments and constructive criticism. Bear in mind as with any new web document, that there are probably numerous minor bugs in the html markup that I have not yet detected.

PROJECT SLOGAN:

Let's Put the Radio back in Packet Radio!!!!!

If you are using MOV varistor surge protectors on these computers, that may be one of your problems, assuming that your computers are using switching type power supplies. Virtually all computers exceot a very few do use the switcvhing type power supplies.

The clamping action of the MOV varistors knees up the ground line and through the effects of the switching power supply in most computers. This raises the ground foil lines to about a fourth of the peak surge voltage that was originally present on the ASC input lines to the deal.

A 6000 volt spike on the AC lines that gets clamped by the MOV's surges all the external modem ground foil lines and the 1488/89 line drivers up to a neat 1250 volts or so! They don't done like that, even for VERY short periods of time!

The net effect of all this is that, while you think you have phone line and modem faults, it is NOT really there. It is this ground buss spike that came in from the switching power supply that may be killing your equipment!

I gave up using any type of switching power supply stuff anywhere there was a real lighting hit problem. I stopped losing gear from this problem. Here, all computers that I use in RF locations like this are the Integrand Research industrial cases with the old fashioned 40 pound pig iron fully shielded isolation transformer linear DC supplies! What happens now is that the MOV varistors get blown to bits, but no more computer losses, so far.

A second thing that you can do is NOT to use the common variety surge suppressor stuff, but to go to the full industrial stuff from PolyPhasor or at least one other source. There is an outfit called Zero Surge in New York, that makes a tuned circuit surge protector that smoothly uses a slower ramp time on the surge protection that keeps it from going over a 300 volt

level even up to a 6000 volt input lightning spike.

Using a combination of these two suggestions, as well as what all else is in the PolyPhasor handbook, "The Grounds For Lightning Protection", can do as much as can be done to help you.

There will always be the big one that gets away, like in fishing......

However, you can likely improve your odds by thinking about this and changing your system to a more secure industrial level power platform, I suspect.

>KenN2SQW @ AOL.COM

>Tnx and 73 de Ken

Hi Ken.

A hard reset is indeed needed. After that, you also need to set the PBBS to 128
(or less if useing the node) useing the PBBS XXX command.

On thing you can do, is open a text file from your term software, and type
DISPLAY. After the whole thing has scrolled by, close the fle.

All of your paramaters will be saved to that text file...all you do is reset
the TNC, then send that text file back to the TNC, and all of your settings
will be restored. Dont forget about the PBBS command tho after you restore
it. :)

If I can help further, just yell.

Take care.

VERY VERY small. With 99% of the amateur packet systems stuck in the 70's at
1200 baud or less. Piping in a windoze box seems like a exercise in futility.
First thing you know someone is going to want a web server instead of a bbs!
Nah!

Beyond that i'd be surprised if the MStcp stack deals very well with return
times measured in minutes rather than fractions of seconds. I'm afraid the
majority of connections you could make on your local packet network would look
like 'time-outs' to the win95-box.

Gentlemen, and I always use the term loosley as I know how I amc
Compliance with any rule or law is needed in a society of strange
creatures the likes of wich we indeed are.

Seriously, can any of us state without a doubt if non-ionizing radiation is
harmful or not???? Folks in the past thought that driving a car on a
sunday spin or sight seeing trip was safe also. Just look at the record

of peoples killed in auto accidents to shoot that theory down. I know, it isn't the same thing, but no one can tell us yay or nay if radio waves will do permanent damage to your neighbors or not. So why not take that extra precaution and put together a system that has preventative measures in the first place, then later on you may be one of the few amateurs still operating out there. Another thought entered my mind (hmmmmm, musta left my mouth open again and one of those pesky things snuck in) about something called "good engineering practice" when building any piece of gear. You wouldn't leave your high voltage tank circut un-protected so that a member of you family could stick a finger in it now would you. (the question is, does the electricity kill you or is it your reaction to the high voltage that does the deed?)
Just a few thoughts from a former broadcast engineer that went through this 10 years ago. (including having to try to deny access to surrounding public lands adjacent to the 100K FM transmitter site.) Wether we agree or disagree with the rules, remember, the FCC and EPA and local and Federal government make the rules and can shut you down right or wrong if you infringe upon them. Also, by having a national standard we will be better off than if every Tom, Dick and Harry has a differant standard that we have to try to follow. So there is no cowardice in following the rules to protect your own hide from bureucratic invasion into your shack and the removal of your equipment and some of your hard earned cash from your person.

The use of some good, and I mean **GOOD**, surge protectors goes a long way in keeping problems out of your modems and computers. I have every line, telephone, cable and electrical, running through surge protecters where they enter the house and also at the equipment end of things. A few of the phone lines have protecters that beep when a surge hits them. I have heard mine beep a few times and have not suffered any damage. Even the plug in wall power cubes are plugged into surge protected power strips. The reason for this is that lightning does not have to strike the phone lines direct for it to send its' magnetic pulse into your home in the form of a huge voltage spike. In fact, most lightning strikes enter homes via that route rather then via the direct strike on an antenna or wire. I hope this helps, I have seen modems and other items of gear damaged by the fact that the wall-wart or plug in power cube that most manufacturers send with the gear are plugged into an unprotected outlet even if the rest of the gear was double protected. Folks, protect the wall-wart, wall tumor or what ever you wish to call them the same as the rest of your expensive gear. A little extra cost will go a long way in savings from not having damaged gear.

Ref: Environmental Impact Reports...

Over the years, we have noted that there is a group within the
Environmental Agencies that tends to go bananas! To acquire
funds to increase staffs, set up new departments, etc., these
groups will go to any lengths to stampede the people, members
of Congress, into a tizzy! This is all intentional...they do not
necessarily know that anything is wrong...not enough data,
not enought testing, etc.

Sad situation, in an Agency as important as this one, that we
have these "whackos" still embedded there. They need to
be purged, their agendas are not in line with the real world
needs of an Agency of this importance. Out, out with them!

Recently, the "hole" over the Antartic filled in...ozone
has returned...years ago, some "real-world" Nasa scientist
warned the "whackos" of the Environmental Agency
that their statements were premature and not substantiated
with known historical fact...nor was there sufficient historical
data to make such a statement....however, the "whackos"
message was widely spread by the "media"...it was pronounced
as "fact"...nothing could be further from the truth! We all remember
the hue and cry...the sky is falling..the sky is falling..disaster..
more funds..more funds! Sick situation..sick..sick!.

Leonard...

As I recall (it's been too many years to be sure) FM is subject to what
used to be called the "thershold effect" where a small increase in
received signal will make a substantial difference in perceived noise.
This is what gives rise to the "quieting" effect mentioned by the
original poster - as in full quieting.

So, it seems your observation might be correct for someone running
SSB phone but not FM phone. Don't know about ACSSB.

Nope, you're I'm not going to let that one slide by. There are too
many other factors that could lead to the onset of cancer in Amateurs.
PCBs, work hazards (a lot of hams are in high tech jobs) etc..
Statisticly speaking, statistics don't work. They are only as acurate
as the intent and will of the statistitian.

>The frequencies where (RF heating) exposures are most harmful to humans

Couple? I suppose the good doctor had a flesh-dip meter? (GRIN) Did
he find that the subjects exhibited lower SWR characteristics when
loaded up for 30-300 Mhz operation vs. above/below?

"Well, we're not sure on this guy. Couldn't get the Gamma match to fit
on his arm, and he complained about where we put the SO-239."

>at other frequencies casually, but the evidence does indicate that
>higher or lower frequencies don't couple as strongly to the body.
>Therefore a higher exposure limit for them is tolerable.

I would much rather have a 20m antenna 10 yards from me, lit with
1.5kw then a 2.5gig magnetron at 750w. I wonder why microwave ovens
operate on the bands they do and not on 10m and 2m? And you say the
higher freqs are more subtle with regards to effect and heating? I
don't think so.

"Since the EPA regs were added, a lot of the guys who run QRO call a
QSO 'OM-BBQ'"

^^^^^^^^^^^^^^^^^^
Always looking for a reason. All in the name of safety. Never any
proof. Statistics are not proof, they are an indicator.
You can get one set of stats from the media, and read something
completely different from the MMWRs from the CDC!
(Morbidity and Mortality Weekly Reports)

EXAMPLE:
Like the 'assault weapons' crap. You hear how they are the preferred
weapons of criminals, and used in the majority of deaths in the
country. Then you read the Governments OWN statistics, you find out
that 'assault weapons' contributed to about .8% of total gun violence
in the US. (Firearm inflicted injury, 1995)

>but the mechanism isn't understood yet. Athermal effects have been
>most noticed at lower frequencies, particularly when those frequencies
>are pulsed at a low rate, IE in amateur radio that would correspond
>to OOK Morse style signals. In vitro studies have shown changes at
>the cellular level when exposed to fairly weak pulsed RF fields.

Oh no! An excuse to get rid of CW? (GAG)

>In particular, pulse rates in the 5-10 pps range have been shown
>to cause abnormal chromosome division. This is usually taken as an
>indication of a cancer causing agent at work.

Maybe this is the secret to evolution? If we didn't have small changes
in chromosomes, we probably would not exsist. And if we did, we would
probably all look exactly alike. I wonder what measurements are made
with respect to the amount of 'natural radioation' we receive on a
daily basis? The effects of cosmic rays on human development?

Although a ham for quite some time, I'm just starting to play around with packet.

I've looked through quite a bit of software, and I can't figure out how to do this..

I have a PK-96 TNC and so far I seem to be most comfortable using PAKET61

I'm trying to figure out how to poll my local PBBS (FBB Style) and retrieve any mail I have waiting and store it locally in the TNC or some software package.. I would also like to be able to enter a message locally and have it transfer to the PBBS..

How do I do that?

Second question.. What Windows/WIN95 Terminal/PBBS programs are there?

Um, this is yesterday's solution. Back in the dark ages of the internet (18 months ago) I used to use a book called the internet yellow pages. With the advent of the search engine (Alta vista, Lycos, Deja News etc...) it is easier and quicker to do an online search.

Good luck, I think you will need it.

>TDMA systems (IS-54, GSM)

Some of the papers I have read show as much as 8x capacity increase,
but I suspect that in, as you say Phil, the real world, the 6x
increase is more realistic.

>> Better yet, it doesn't take a Phd. to understand it.

>I don't have a PhD, yet I believe I have a pretty good understanding

Well said, Phil... It is very clear and simple to understand the
possible benefits of SS if one just keeps an open mind and is not
automatically opposed to anything that is new and/or different.

>> The real benefit lies in that it is inherently encrypted, and
>> that these high-compression heads can line their pockets with
>> the U.S. government's research dollars. What a SCAM!

>Nonsense. The parameters of the IS-95 CDMA waveform are publicly

>TDMA or FM, that is likely to change with time as the chips and
>phones become widely available. In my opinion, there ought to be
>extra encryption to protect privacy, because the "inherent encryption"
>is quite weak.

Again, well said, Phil... All one needs is the spreading code and SS
has no more "encryption" than any single frequency signal. In the
cellular/business services, true encryption is needed very badly.

>Phil

A terribly misdirected group. May be so may not be so. Do you have any
facts to show that rf is harmless. Have you ever been in the near field
of a broadcast antenna at 1KW even. I have, not the facts or figures,
but by personal experiance know that the inner ears heats up at a
frequency of 1450 Khz and 1000 watts if you are there for any significant
period of time (ie. 30 minutes or so) Granted, amateur transmissions are
usually short, but would you like a 4 El beam being fed with 1.5Kw pep rf
pointed at your house???? I think not if it were your neighbors
antenna. Do not poo poo the harm that non-ionizing radiation may or may
not do. It is best to treat it with a little respect and use good
engineering practice at all times. Hey, a well meaning, but misdirected
group got a law passed because no one else has been able to prove them
wrong with hard facts and figures. I for one, after spending a few years
in the position of a chief broadcast engineer, treat an radiation,
non-ionizing or otherwise with respect. remember your microwave oven
operates in the middle of on ham band a about 1.2 gigahertz or so. And
it cooks things very swiftly. Agreed it is not 3.9 Khz or 7.2, but it
may be that the only differance is the power level and the exposer time??
who know for sure. I don't and have met few rf engineers that are sure.
Who wants to be the test dummy for this one fellows. Do I hear any takers?

Hello!

I am curious if there is a #channel on IRC where amateur digital
discussions take place.

I am interested in high-speed and TCP/IP via amateur radio discussions.

Thanks es 73,

Teach me what? What in my post are you reffering to?
But regardless, I am sure there is a lot I can learn from a ton of
Amateurs, thats why I love this hobby/service so much.
Always something you don't know, and a person willing to tell you
about it.

See ya

IT'S ANOTHER WINDTRAX
AMATEUR RADIO BALLOON FLIGHT!

All are welcome to participate and join in the fun!
We expect this to be another successful ATV, Repeater,
and GPS/packet flight of approximately 2-3 hours duration,
and the pre-flight and post-flight nets will extend the fun.
Join us!

DATE: August 24, 1996
TIME: 1200-1300 UTC (0700-0800 Indiana time) Wx dependent
LAUNCH SITE: Purdue University Airport, Lafayette, IN.

Prelaunch Freq's: HF check-in @ 3.869-3.871MHz
2 meter locals 147.135/R (W9YB)
Nets will begin at 1130 UTC

Flight Package's:
Crossband repeater provided by W9DUU, Paul
2m rcvr to 6m & 70cm xmtrs, with voice ID
Using half-wave antennas and 100mW.

GPS/Packet system provided by WB9QPG, Dave
Garmin GPS rcvr, controlled by MIM packet & downlinked to 145.79MHz xmtr, lithum powered.
1/4 wave antenna, 100mW output.

ATV package by KT9V, Terry
Contains two B&W CCD camera's & a WB8ELK color
video graphics card. Downlinked on Wyman ATV xmtr via 1/4 wave antenna. Lithum powered, the
cameras are aimed horz. and vert, with controlled switching.

Flight Freq's:
Crossband Repeater Dwn 52.525 & 444.85MHz
(50mW & 100mW) Up 144.3MHz
GPS/Packet: Dwn 145.79MHz @ 1200 Baud,(VP) 100mW out
ATV: Dwn 439.25MHz (VP) 1.5 watts output

Balloon Type: Kaymont 1200 Gr.
Parachute: Custom made by KB9BSV, Barb, is 5' in diameter

We welcome your email notes regarding your reception!

There are a bunch of them. A summary of some relevent ones can be
found at the end of the NCRP Report No. 86 which is a major part of
the the basis for the standard the FCC has adopted. Dr. John Moulder
at the Medical College of Wisconsin maintains a number of FAQs on
non-ionizing radiation exposure. The FAQs have a large number of
references. Look over in sci.med for the FAQs.

>PCBs, work hazards (a lot of hams are in high tech jobs) etc..
>Statisticly speaking, statistics don't work. They are only as acurate
>as the intent and will of the statistitian.

Statistics can show us correlations. Correlation is not necessarily
causation, but it is sufficient to cause us to take a closer look
for a causative link, and if strong enough, sufficient for us to take
prophylatic measures even if we haven't discovered the exact causative
link. For example, if I drop a 2 kg hammer on your foot from a height
of 1 meter, it may or may not break a bone depending on how it lands,
how dense your bones are, etc. Now if I drop the hammer on your foot
1,000 times, statistics say a bone will likely be broken because it
will strike with an edge on a small bone sooner or later and concentrate
enough force to break it. Or, I can take the hammer and drop it once
on each of 1000 people's feet and get roughly the same correlation.
Some people will have smaller bones, some will have brittle bones
(osteoporosis), some will just be unlucky with the impact angle, etc.

Correlation isn't 1 to 1 with causation, but if it is significantly higher than the number of broken toes I see among a population who isn't at risk of having a hammer dropped on their foot, l'm likely to recomend a prophylactic measure like steel toed safety shoes for people likely to get a hammer dropped on their foot even though I can't predict the outcome of any particular drop.

Now if I substitute a 200 kg safe for the hammer, the correlation is going to be so strong that I believe even you might consider wearing steel toed shoes. (That would be equivalent to an RF exposure significantly larger than 10 mW/cm^2.)

>
>Couple? I suppose the good doctor had a flesh-dip meter? (GRIN) Did
>he find that the subjects exhibited lower SWR characteristics when
>loaded up for 30-300 Mhz operation vs. above/below?

Indeed, what is regulated is called SAR. SAR is similar in concept to REM for ionizing radiation. Different frequencies of ionizing radiation from soft X-rays to hard gamma have different effects on the body. While you might get the same number of RADs from a dental X-ray as you'd get from exposure to a cobalt 60 source, the REM (Rad Equivalent Man) exposure you'd get is very different. So it is also with SAR. Different frequencies are absorbed by the human body differently depending on a number of factors, including resonance effects, so in a sense the SWR *is* different when the body is excited at different frequencies.

The SAR for various frequencies is determined by calorimetry. The limit exposure is 4 W/kg of heat in the tissue. Experimenters (using corpses) subject the body to different frequencies of RF at a given surface power flux in mW/cm^2 and measure the energy deposited in the flesh for that power flux at that frequency. The result is the familiar chart seen in the ANSI and NCRP standards. Similar to a RAD to REM conversion chart, this chart shows the relative values of biological absorption for a given frequency and surface power flux.

Looked at in antenna terms, the human body is 1.5 to 2 meters tall, and serves as a resonant structure in that range. And when you look at the exposure chart, the frequency range between 30 and 300 MHz is, unsurprisingly, the one with the lowest permissible power density. Currently, SAR is measured only for whole body exposures, but there is some concern that various subparts of the body (notably the skull) form resonant structures at higher frequencies (such as cellular). By the time you get up into the microwave region, however, gross body structures are too large to be resonant, though there can still be localized hot spots in the body.

>operate on the bands they do and not on 10m and 2m? And you say the
>higher freqs are more subtle with regards to effect and heating? I
>don't think so.

Microwave ovens operate where there is ISM spectrum. There happens
to be an ISM band at 2.4 GHz, and magnetrons for that frequency
happen to be cheap to produce. Another ISM band (900 MHz) couples
more strongly to flesh, and is used in certain large commercial
RF ovens, but the circuits are more expensive to produce for a
given heating value, so consumer microwave ovens operate at 2.4 GHz.

There are other ISM bands too. One is 27 MHz. That is used for
plywood drying (hint: 8 foot sheets). Another is a spot frequency of
13.56 MHz (near 20 meters). An ideal frequency for heating flesh happens
to be near 1.4 GHz, the "waterhole" resonance, because the body is 70%
water, but that isn't an ISM band, so the oven manufacturers couldn't
use it.

>"Since the EPA regs were added, a lot of the guys who run QRO call a
>QSO 'OM-BBQ'"

Well, the EPA didn't set these regulations. The Telecommunications
Act of 1996 mandated the FCC to set these regulations based on the
best scientific evidence available, and that's the NCRP-86 and ANSI-92
standards.

>>The new MPE is 1 mW/cm^2 in the 30-300 MHz region. That gives at least

>proof. Statistics are not proof, they are an indicator.
>You can get one set of stats from the media, and read something
>completely different from the MMWRs from the CDC!

>(Morbidity and Mortality Weekly Reports)

Yes, as noted above, correlation is not necessarily causation. But
as also noted above, it can be compelling reason to take prophylactic
measures. (That's particularly appropo for things like AIDS and HIV.
There is a very strong correlation between the presence of HIV in
the body and the development of AIDS. The exact mechanisms aren't
all known, and various co-factors may need to be present, but taking
prophylactic measures against HIV exposure is still a very prudent step.)
The same is true with low level RF exposures. There's no doubt whatsoever
that high level exposures to RF are harmful, immediately and drastically,
but there is also a strong enough correlation at low levels of exposure
for longer term effects to make it prudent to take prophylactic measures
by setting exposure limits.

>EXAMPLE:
>Like the 'assault weapons' crap. You hear how they are the preferred
>weapons of criminals, and used in the majority of deaths in the
>country. Then you read the Governments OWN statistics, you find out
>that 'assault weapons' contributed to about .8% of total gun violence
>in the US. (Firearm inflicted injury, 1995)

Indeed, but that proves nothing either. There are roughly 200 million
firearms in civilian hands in the US, less than 15,000 are used annually
for violent murder (or suicides). That's only 0.0075% of firearms. Most
of the ones used in crime are stolen.

The so called "assualt" weapons made up 8% of all firearms available
"off the rack" for sale prior to Comrade Clinton's ban. If gun type
choice were random, we'd expect roughly 8% of the weapons used in
violent crime would be "assualt" weapons. As you note, the number is
actually 10 times less than that. Does that mean criminals don't prefer
"assualt" weapons? Maybe, maybe not.

Criminals don't choose their weapons "off the rack" because they've
been forbidden to purchase weapons at retail since 1968. They get them
mainly by theft, and the most common firearm stolen is the Smith and
Wesson Model 10 (because there are millions of them out there in civilian
homes, and on police belts, the majority of police killings are with the
officer's own gun), so unsurprisingly, that's also the most common firearm
used in violent crime. But does that make it the weapon of *choice*?

Probably not. Given a *choice* criminals might prefer a submachinegun,
but they don't really have that choice because there are less than
150,000 of them in civilian hands, and they are generally well protected
against theft. So criminals have to settle for less than their preferred
choice and use what they can most easily get.

I happen to believe that criminals wouldn't make an "assault" weapon
their first choice anyway. They're no better than any other cosmetically
challenged semiauto rifle, and they are much harder to conceal than a pistol.
Since criminals generally have to be stealthy, big ungainly weapons aren't

very suitable. But the statistics don't prove that one way or the other.

>>but the mechanism isn't understood yet. Athermal effects have been
>>most noticed at lower frequencies, particularly when those frequencies
>>are pulsed at a low rate, IE in amateur radio that would correspond

>>the cellular level when exposed to fairly weak pulsed RF fields.
>
>Oh no! An excuse to get rid of CW? (GAG)

Actually, the evidence is pretty darn compelling. This is one of the
strongest associations between athermal RF and biological activity.
The range of 5-10 pps is also the range of brainwave activity, and
includes the 7.62 Hz resonance shown to have behavioral effects
in animals.

>>In particular, pulse rates in the 5-10 pps range have been shown
>>to cause abnormal chromosome division. This is usually taken as an
>>indication of a cancer causing agent at work.

>probably all look exactly alike. I wonder what measurements are made
>with respect to the amount of 'natural radioation' we receive on a
>daily basis? The effects of cosmic rays on human development?

Natural RF radiation exposure is truly minute. There is less than
300 kW-hr daily of naturally generated RF energy on a global basis.
(Mostly due to tropical lightning discharges.) Humans didn't evolve
in a high RF environment. It is only in the last 80 years that
humans have been exposed to any great extent to RF, electric, and
magnetic fields oscillating at ELF to SHF frequencies. That's not
nearly long enough to make an evolutionary adaptation.

This problem isn't unique to switchers, and it isn't a fault of the MOV
either. As long as the green "safety ground" lead is connected to chassis,
the ground buss of the computer will be elevated during a strike, regardless
of whether the power supply is a switcher or not, and regardless of whether
you use MOVs or Polyphaser gas discharge suppressors on the AC line.

I don't like switchers because they can *lose regulation* easily when
disturbances occur on the input lines, but the scenario you propose
will happen with linear supplies as well.

>I gave up using any type of switching power supply stuff anywhere there was

Unless the supply breaks the safety ground path, it won't protect from
your posited failure mechanism. However, a linear supply, especially one
with a Faraday shielded transformer, will communicate fewer power line
disturbances to the DC circuitry.

>A second thing that you can do is NOT to use the common variety surge

>in the PolyPhasor handbook, "The Grounds For Lightning Protection", can
>do as much as can be done to help you.

Good quality suppression is important. More important is to follow
carefully the advice in the book about single point grounding.
That way, even though the ground point is elevated in potential
during a strike, so will be the ground of all other perpherials
connected to the computer. No potential difference, no damaging
current flow.

Note, there was an error in the H field calc. See the follow up
for a correction. Realize too that this is merely a crude approximation
based on an isotropic source. You have to adjust it for the parameters
of your actual antenna. It can serve as a ballpark estimate, but no
more.

>
>73 de Misko YT7MPB, the Secretary of YU7 ham radio union

There are two critical items. First the site should practice single point grounding. All equipment should be grounded to one point and one point only. No ground busses, no daisy chains. This point should be the site ground window, IE a copper plate through which *every* cable entering or leaving the area must pass. Any wire that is nominally "ground" should be directly bonded to this plate. Any wire that is nominally "hot" should be connected to the plate via a suitable suppressor. (The proper choice of suppressors and their installation is a fit subject for a much longer article.)

The concept here is that regardless of strike current generated potential drops elevating site "ground" to a high potential, *everything* on site rises to the *same* potential (or to a potential within the capabilities of the equipment as enforced by suppressors). With no potential differences, no damaging currents can flow.

This is a really simple concept, but *one* single wiring error which bypasses this scheme can undo every bit of protection it offers. Analyze the site carefully, don't use "temporary" wiring which bypasses the ground window, don't scrimp on suppressors. And most of all, don't daisy chain grounds or use a ground "buss". That will surely cause a ground loop, and allow your equipment to be damaged. All grounds must be star connected to the single point at the ground window. Nowhere else. No exceptions.

>Leonard...

The "hole" fills in every year as the polar vortex breaks
up and the stagnant air is diluted by fresh air from the mid
latitudes. This isn't new, or news. Certain conditions have to
exist for the ozone hole to form. The stratospheric temperature
has to drop below -60 C, the air mass must be stagnant, and
enough Cl or Br radicals have to be present to catalyze the
decomposition of ozone. That also happens once a year.

What has the "whackos" in a tizzy is that in the 1950s there
was no ozone hole that formed once each year, now there is.
As stratospheric Cl and Br radical concentrations have increased,
thanks mostly to CFC discharges, so has the size and duration of
the ozone hole.

Some of us may be tempted to say "so what" to this. The hole is confined to Antarctica and we don't live there (nor does anything else of much global importance). Some of the "whackos" (of the no sparrow, or spotted owl, shall fall variety) are agitated and alarmed. Perhaps we should ignore them. But there are also "whackos" of the "if this goes on" variety who we can't dismiss so lightly.

The global ozone level over the mid latitudes is thinning too. Because conditions aren't as extreme as in the polar vortex, there is no hole (and probably can't be a true hole) at the mid latitudes, but there is a measurable increase in shortwave UV getting through. *We* live in the mid latitudes. This should concern us, at least a bit.

On the flip side, low level ozone concentrations over our cities are increasing. This shields us from the UV leakage through the thinning upper atmosphere ozone layer. But the "whackos" want to *deplete* this ozone layer. They say it is bad for us to breathe. They're right too.

Perhaps there has been over-reaction (led by the "no spotted owl shall fall" crowd), but *some* reaction is prudent. Neither we nor the plants we depend upon have evolved to tolerate the higher levels of shortwave UV now getting through. A cautious step back from casual releases of Cl and Br radicals is warranted.

The dwell time for these radicals is on the order of 50 years, so there's no immediate way of knowing whether serious or trivial harm is being done until it is far too late to reverse the process. So it is wise to take prophylactic steps now in case the effects of increased UV in the mid latitudes causes large scale harmful effects.

Source record: 35014

Hello, I just had a MFJ-1270c TNC go bad on me. I am running X1J Firmware. When it is turned on it leds cycle properly and then the STA lights dimmly as it should for 10-15 seconds and then extinguishes. At this point the TNC is locked up. I have tried different firmware, Z80, SIO/O chips and ferified the +5 and -5 busses without any luck. Any input would be appreciated.

Does anybody have the changed that need to be made to a 1270B revision 2 TNC so that it can run X1J? Thanks!

The KPC-3 did a hard reset when you installed the new RAM - all
settings were stored in the old RAM. Doing another hard reset won't
help - it sounds like you may have a bent pin on the RAM chip you
installed. (or a bad ram chip).

It appears your deviation is set too low. Try adjusting the drive from
the TNC per the manual. Failing that you can increase the deviation in
the radio. If you need help drop me an email and I will help you work
out your problems.

I am involved in a project to put up mountain-top, stand-alone packet switches/routers for research and academic institutions here in the Philippines. I would like to hear about anybody's experiences with the Gracilis Packet Ten switch, good or bad. I would also welcome any advice.

The network involves linking mountain-top relay sites with distances from 10 km. to 40 km. We intend to use P10's and GRAPES modems with DownEAst Microwave transverters, but have also heard that spread-spectrum radios may be an option, if these can handle the distances.

As an option to spectrum/allocation problems related to the use of GRAPES modems and transverters (we do not have the 100 Khz, 220 Mhz channel allocation here), we are also considering the use of Cylink spread-spectrum radios to be driven by the P10's. Will we not have interfacing problems with this set-up?

Feedbacks/advice will be most appreciated.

An interesting discussion!

When I first heard of the Milham (?) study, I was told that the figures for hams were based on selecting names that appeared in "Silent Keys" in QST and that the "general public" is what the smaller group was compared with. A question I had at the time that has not been answered is if a similarly sized subgroup was selected based on some other criteria was examined to see if the same kind of statistical variations would appear. Apparently, while hams appeared to be slightly more likely to die of some kinds of cancer, they were also slightly less likely to die from other cancers.

It is my understanding that the database on which the study was based is not publicly available. If this is so, the study is seriously flawed in that there is no way I or most anyone else can tell if the conclusions extracted are in fact supported by the data. Given that the observations on which the conclusions were based are unavailable, the conclusions can have no scientific validity. Note that I am not saying that the conclusions are wrong. I am saying that niether I nor anyone I know is able to repeat the observations and independently confirm or refute the conclusions.

Put simply (and crudely), Joe McCarthy had a list of "bodies" too.
How many of HIS claims were true?

4470. MFJ 1270C/9600B problems ... some answers

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-08-22 00:00:00 UTC
From: cornwaab@ednet.ns.ca
Message-ID: <4vhku2$jn6@Trademart-1.EDnet.NS.CA>
Source record: 35016

I am reporting back on an inquiry that I posted here about one week ago concerning two problems encountered with my MFJ1270C/9600B TNC and 9.6K bps modem. Although I am still experiencing the problem of sometimes not being able to transmit while the TNC is in full duplex KISS mode, the DCD flicker seems to be solved and is fixable with a simple modification to the 9600B modem, explained below.

Here is the description of the problems from my original query sent to this bbs/news group:

1. the DCD light flickers even when no carrier is being received. This occurs when connected to either my Yaesu FT736 and MFJ 8621 data radios. In AX25 mode the consequence is that the TNC is reluctant to transmit because it thinks that a carrier is already on-frequency. After a while it will transmit. I can tell the TNC to ignore the 'flicker' by setting full duplex ON. I have experimented with various audio-in levels, but this does not seem to matter.

2. in KISS mode when receiving data from KO-23, the TNC refuses to transmit. I cannot even do a manual directory request. When I disconnect the receive data line the TNC will send out a backlog of transmissions. Moving jumper JP8 (DCD select) makes no difference.

I have an alternate Pacccom TNC with 9.6K bps modem and it does not exhibit these problems. By the way I am still using PB for KO-23 communications.

Al Lawlyer, WB1BQE, reported that he had the same problems with is MFJ1270C/9600B rig. Also John Boudreau, VE8EV, responded that he had similar difficulties with a MFJ1278/9600 TNC and modem.

ANSWER TO THE DCD FLICKER PROBLEM

Zeno Wahl, VE3LMX (G0NJC), analyzed the cause underlying the DCD flicker and suggested solutions, as follows:

"The principle that most DCD circuits work by is to compare the clock recovery circuit output with it's input using an EXOR gate and an analogue RC time constant on the output to generate DC level proportional to how in-phase the two are. This is then followed by a comparator circuit generating the "DCD"

signal.

"If the signal is strong, then the raw input data has relatively regular zero crossings which the clock recovery circuit then "smooths" out to give a clean 9k6 clock output. In this case the average level from the EXOR gate RC filter is close to 3.4VDC (measured). If there is no input signal, the output is close to 2.3VDC (measured, assuming 5V logic). Of course this voltage isn't very constant, and will flicker around a bit due to the random nature of the data and underlying scrambling PN code.

"In your case, trace the DCD line back from the connector pin, it may go through a buffer chip. eventually, you should find a bit of analogue circuitry that implements a comparator (LM339?), with one input firmly fixed at a DC voltage set by two resistors forming a voltage divider, while the other input has a low-pass RC filter ahead of it, resistor leg leading to an EXOR gate (HC86?). The trick is to get the comparator level and time constant right. In the G3RUH modem, the R-C is 100k and 100nanoFarads respectively. Time constant is therefore 10ms. The DC comparator threshold is set to 2.9V (33k to +5V and 47k to ground).

"I suspect that either the MFJ 1270C modem time constant is either too small, causing large variations and triggering DCD occasionally, and/or the comparator threshold is too low, also resulting in DCD flickering in the absence of a signal. Having a larger time constant is better in regards to preventing false triggering, but slows down the DCD response time."

Following Zeno's instructions I examined the schematic diagram and circuit board of the 9600B. Sure enough, there is an LM339 voltage comparator with a pair of resistors setting the reference voltage on pin 11. The voltage measured 2.75, however, not the 2.9 volts that Zeno said is typical of a G3RUH modem. Instead of a 33K ohm resistor as one of the voltage-divider pairs my board had a 39K resistor (the other was 47K). I found that by placing a 390K resistor in parallel with the 39K resister, labelled R5 on the board, the comparator voltage went to 2.87 volts and the flicker stopped.

I tested the modification by signing on to my Paccomm 9.6K modem and MFJ-8621 packet radio. The communication was flawless. A test YAPP file transfer was lightening fast compared to 1.2K bps. A download during a KO-23 pass also proved that the mod worked. I made the mod permanent by tack soldering the leads of the 390K resistor onto those of R5, using minimum heat to avoid

dislodging R5 from the circuit board.

Based on my experience, anyone having a problem with DCD flicker with similar MFJ equipment may want to consider this modification. Although R5 is the designated resistor on my MFJ 9600B modem with Rev. 1.4 circuit and board, there may be other components involved on other MFJ modem boards. Zeno's analysis is the key to working through the solution for other boards.

KISS - FULL DUPLEX TRANSMIT PROBLEM

Al Lawler suggested the following reason why the TNC might not be transmitting when receiving KO-23 in full duplex KISS mode, as follows:

"Regarding your second problem (the TNC refusing to transmit), I think this is a known bug. (Mine does it too.) Basically,in Fulldup mode, if the TNC doesn't start getting data within 3 minutes (or so), it automatically reverts back to half duplex .... I'm not sure what application you're using, but the new version of WISP (wisp9601.zip I think) gets around this by re-sending the "full duplex on" command again, once it starts receiving data from the modem, in case it has been more than 3 minutes between modem initialization, and satellite signal acquisition."

Chris Jackson, G7UPN/ZL2TPO and author of WiSP, confirmed Al Lawyer's diagnosis. Chris states that there is a known problem with some versions of TAPR code which blocks transmission in KISS; although he observes that the problem may not exist in newer releases of the code. WiSP by-passes the bug by sending a 'full duplex-ON' command to the modem when data is received from a satellite.

John Boudreau's experience is consistent with Al's explanation and the use of WiSP as a way to avoid the problem. John reports: "I also ran into the same problem with PB/PG and the TNC not wanting to transmit. I never did find the exact cause but it went away when I switched to WiSP".

My experience is that the MFJ1270 works well with KO-23 if it has been freshly started in KISS mode by the PB program. If a few minutes go by before KO-23's carrier is detected, however, the TNC won't transmit. About 3 and one-half minutes after being booted into KISS mode the TNC's STA and CON lights blink a couple of times, which leads me to think that full duplex capability has been cancelled although technically the modem remains in KISS mode for receiving. The version of the firmware in my TNC is MFJ release 2.2 dated 1966.

IN CLOSING

I apologize for using so much bandwidth to document these problems. It may be that Al and I, and John with his MFJ1278, were among the unlucky few to obtain units having DCD flicker. At least with this investigation there appears to be a way to fix it.

I am still looking for the definitive solution to the KISS full duplex transmit problem, which appears to afflict many TNCs.

Thank you Zeno, Al, John, and Chris for helping me.

Sure! MAX is free. Our HUB runs it, but not the OS/2 version. It comes
in three different packages that I know about, DOS, WIN 3.1 and OS/2.
My intention was to convert f3000.n117.z1 to it from my old OPUS 1.73
which I still run, but I've got a large number of other hand written utilities
for OPUS I just do not have time yet to get done for MAX. The HUB, who
also ran OPUS for a long time, prior to converting to MAX, tells me I will
be right at home as MAX was based on the old OPUS code and has the
same type compiled BBS.CFG sort of setup.

In addition, we have a Net 117 member who is running a new one called
SHOTGUN which is written for Native OS/2. That one is a paid for one,
but he says it is worth it.

I noticed that you are a ham operator from your call. I've got a small
change I have to make in my domain stuff at ziplog.com today. After I
get that done, I'll email you. If that works and you don't have an FTP
site from which you can get MAX, I'll make arrangements to get the MAX
latest OS/2 version on disk for you and snail mail one to the Barbadoes,
as well as to get you the WIN 3.1 code and DOS code so that a crew of
you could have fun smashing all the same code.

When in a dog fight, it's best to have all the same breed, that way you
you can come up with best of breed....

It used to be that Pete Norloff's www.os2bbs.com was run on MAX as a
dual FidoNet/IP site. All of the required code list was there in his web
page for you to note, but you couldn't copy down or FTP anything from the
site unless you were a paid member, I think I saw.

MAX may even be on the Hobbes site, which if they ever get the security
block botch fixed so that anonymous users can download again, may be your
answer for FTP free. I don't know, but surely MAX must be on that one
somewhere too. I read today you could do an LS to them and get around

the glitch with your FTP access, but have not tried that yet.

You can comment back to me here and I'll try to help you any way I can.
One of these days, maybe you could have FTP'd it from even me!

:)

Hello there,
if you have g8bpq v4.08 you have to put the bpqdll.dll file in the
windows/system directory.
In the WinFBB configuration you must fill in the ports configuration,
BPQ Port:0.
This is verry important!!!!!
Than you put in your autoexec.bat,the normal start procedure,for the
g8bpq.
cd G8BPQ
call bpqcode.exe.

73 BE4SAM sysop the DF1BBS.

If you still have problems,mail me :karel.cornelis@ping.be
I think you are from the netherlands,so you can mail me in dutch..

4474. re: FCC Ruling Will Require Some Hams to File Environmental Impact Reports

My layperson's understanding of this is that even if we were to be required to file such documents under NEPA (or CEQA in California), they very strongly frown on duplicative efforts. In many cases, existing studies of essentially the same problem can often be included by reference. So, for example, if W1AW were required to do an EIR and the ARRL was sufficiently dilligent in preparing its report, then those of us whose situations were sufficiently similar (or obviously less severe) could utilize their work, and would likely require very minor individual effort. (Of course, this should be considered as the speculation of an untrained concerned citizen and appropriate counsel should be sought if the question at hand applies to you in more than a theoretical or rhetorical context).

There might be a fairly simple way to implement point-to-point
links using CLOVER (or TOR for that matter). The idea is to write
a loadable back end driver for the G8BPQ switch. I actually started
on this project, but got diverted to doing other things. Have all
the required CLOVER device drivers (for the PCI4000, P38, and DSP4100),
but have NOT been able to find complete documentation on the BPQ
back end interface.

There is some info in the bpq release, but it is incomplete.

If anyone has better info, would much appreciate a copy.

4480. Baycom modem - i need some help please

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-08-22 00:00:00 UTC
From: Nuno Sucena Almeida <slug@this-news-group-please>
Message-ID: <5100.aem.840713721@bbs.aeminium.pt>
Source record: 35026

Hello...
ATENTION:reply in this newsgroup or to slug@cygnus.ci.uc.pt

Two weeks ago i build the famous baycom 1k2 modem but unfortunatly i
can't make it work. It seems to transmit well as i can hear the tones (
like some noise) and seems to receive/demodulate well, but i'm not sure
since i don't have a scope...I think the problem is the discrepancy of
voltages as the computer is a PC with RS232 at 12V and the modem is
working at 5V (getting the voltage from the RS232).
I don't know were I got the schematics, but could someone point me a site
were i can get a working one for PC.
The power voltages are correct (aprox 4.95V) when it transmits and when
in stanby (receive) mode and when i put a multimeter (digital but with
two scales, one that simulates a analog,ie, very fast) at the CTS port
it changes rapidly when the modem receives the audio...
Another thing:The radios that i'm using can't disable the squelsh so its
always silent with no receiving signal.So, does the baycom modems needs the
random noise produced at the FM receiver?

The softwarez that i'm using are:

-linux 2.0.7(since i can make ping -i 5 baycomIP and try to receive without
boring another dude and when if it works to play MUD's with all my
friends :)
-baycom software (first try but since i don't understand deutsh :(
-NOS (second try with AX25.COM driver , several versions (TNOS, JNOS,
etc ...)
-TPK (with the drivers for the baycom...)

With all of these software i can transmit but not receive but
with linux i haven't tried to receive since i haven't read the DOCS
on how to do it YET.

tks in advance...

Bingo! That's the rub. You get a packet storm on channel at startup
followed by a time out. Nasty.

Note that the GRAPES modems aren't limited to the 220 MHz band.
They can also be used on any higher band for which you can get a
transverter (such as the Down East units on 70cm). You can certainly
do the distances you propose with that setup. I can't comment on
the Cylink radios. The P10 expects to talk to a synchronous modem,
if the Cylink looks like a synchronous modem (including supplying
clock signals), you may be able to use it.

That's because the DOS box running KA9Q confines the packet storm
to the ethernet via the AX25 Maxframe parameter on the radio side.

Since I've talked to Curt already Chuck, he means an ALLMODE
shareware/freeware package for the PK-232. Or at least something that
would run RTTY, Packet, AMTOR, and maybe PACTOR under WIN95,
or WIN 3.1 for that matter. Seems if such an animal came out, AEA
would have to drop down on the price of PcPakratt for Windows.
Probably not though, as they didn't come down too much on the DOS
stuff. I too would like to find this kind of Win package of the
PK-232MBX. I don't need the ASCII, FAX, or CW modes just the others.
Seems like WINLINK could run the Packet and TOR modes with the
"keyboard" option but no RTTY. But WINLINK is a BBS type package
that has an option where you just use the keyboard to do it.

I believe I've gotten them at Radio Shack in the past. You might bring one that you know fits in the connector, and compare the pin alignment on the RS connector. The pin placement can vary from DIN to DIN manufacturer.

I wouldn't be surprised if you could find them all wired with the 5 pin connector in a network supply catalog.

Gary-

I believe you! Now, how does that relate to the average Ham? Although 10 mW/cm^2 sounds like a miniscule amount, it doesn't sound so bad when you convert it to 100 W/M^2 (did I do that right?).

What are "real world" exposure levels that a Ham is likely to encounter in each of several areas of the Ham spectrum? Suppose I have a 100 Watt HF transceiver to a dipole, about 20 feet off the ground. Is anyone at risk while I'm on the air? What if I run a KW? What if I use a beam that is 50 feet up?

How about a typical Two Meter installation?

What I'm leading up to, is that the FCC might accomplish more, if they were to perform the math (or make the measurements) for common situations, and publish examples where harm might occur.

You're on the right track. If you read the Report&Order, other services
like paging, cellular, etc, received exepmtions for specific scenarios
(like for a given antenna, antenna height, and power below some level).

Why the ARRL went with the silly "prudent avoidance" (whatever that
means)approach is beyond me. What exemption did we wind up with? One,
less than 50 watts (irrespective of freqy, mode, antenna type and height.
This makes no sense. The ARRL "dropped the ball" again.

HELLO FELLOW HAMS:and FUTURE HAMS !!!!!!!

HAM BBS dedicated to amateur radio !!!!

There is a DEVOTED AMATEUR RADIO BBS in town ,from your
ARRL/LAX affiliated club coordinator , JOE CIRA , KB6AXK .....
Everything and anything about AMATEUR RADIO will be found here,
IF NOT ? Let me know and we will post it and file it !!!!!!!!

HAM*INFO*LINK*SOURCE BBS at 1-818-584-1952....
24 hrs,8-n-1,anyspeed.......
running 486/66 with 2.1 gig of space !!!
qsl route database,clubs,newsletters,bulletins,shareware,utility
mods,programs,test ques,lists,software and much more....
VEC/VE exam & class list for all So.Cal.
sample exam tests and answers for all class's..
ARRL mirror of all there files !
Using Wildcat v4.11 software..
easy to log in and no FEE's it's FREE !
6,000 FILES IN 119 FILE AREA'S..so far !

latest list of AMATEUR RADIO WEB SITES & PAGES
now 2,405 websites & pages !!!!!!!!!
and GROWING FAST ?!?!!

P.S. also available on the web at:
http://www.netcom.com/~kb6axk/ham-web-site.htm
or
http://www.padl.ac.at/schule/chemie/bob.htm
look for web-sites by KB6AXK on the page........

FYI:there are roughly ,over 33,000 pages,just pages,
that relate to amateur radio/ham radio on the web ???????
My list is primarlly websites.............

73's & 88's de kb6axk,joe cira,ARRL/LAX/ACC.

snip

>>
>A terribly misdirected group. May be so may not be so. Do you have any
>facts to show that rf is harmless.

It is almost impossible to prove a negative. Please show me a definitive study with a properly established scientific basis that will show that RF is harmful. After all, it is your theory.

This is the same science that stated that bran was wonderful, only to state a few short months later that it was not. The same science that stated that ALAR would kill everyone in the free world, only to state later that the basis was flawed. This is the same science that said the cranberries would cause cancer in huge numbers of people, only to be shown to be false.

Chocolate is SIMILAR to marijuana? The center for science? and disease control is headed by a bunch of people who at best are self serving boobs, concerned only about perpetuating their high paying jobs.

I don't KNOW if RF is harmful or not but virtually everything in the human experience is harmful, or at least potentially harmful. Cars kill thousands every year but we raised the speed limit to 75 knowing that there will be an incremental increase in the highway death toll.

The prez has declared that tobacco (cigarettes) are a nicotine delivery system while VERY recently we de-drugged Nicorette gum. My mother has smoked for over 70 years and is in better shape than most 60 year olds I know. I do not condone smoking but I believe that the benefits to society COULD outweigh the negatives (agreed not likely but every bit as speculative as your hypothesis) BTW, could you name any ... ANY person who has been shown to have died from second hand smoke?? Why has the average lifespan increased in the last 200 years?

Point of speculation.... In 23 years scientists will determine that a pack of cigarettes a day will decrease your chances to contract PMS/Prostate trouble!

Every state (to my knowledge) has some sort of law regulating the sale of cigarettes to minors so enacting new laws is just plain stupid

until we try to enforce the current laws.

Get a clue folks, the government is rapidly taking ALL of yur
Constitutional Rights away. Read the Federalist Papers to understand
that the founding fathers were aware of this possibility and
considered it to be the biggest potential problem the country would
face.

Hi,

CAn I use Baycom under Windows?

thanks,

==========
Yes, well, you can use the modem in windows, but I have not had luck with Baycom/Windows.
Get yourself a copy of WINTNC. This works fine. I can try to find where I got
it from if you like.

Has anybody got the Windows version of BPQ to run *reliably* under Windows95 ?

I found it crashes after a few minutes, taking the whole Windows system down with it.

I suspected it might be an interrupt clash between BPQ and the Windows comms drivers, so I removed the Comms drivers (for the com ports that BPQ was using) from the Win95 setup. That did stop BPQ from crashing the PC, but then BPQ stops decoding about 90% of incoming packets (mainly the longer ones).

I have had to go back to running the "dos" version of BPQ in a DOS window. Not a very good solution!

My friend and I have been working with the HTX-202 and the PB-2M. We are having trouble with this system. The HTX transmits the tone ok but we can not connect or receive. Substituting an Alinco DJ-580 results in an immediate connect. Any suggestions on what to try or to check for? Anyone had experience with this type of radio on packet?

Back about 1989 the guys in Germany produced TheNET and created a big stir as it was so much like NetROM. In the same period a CONVERS version of that code appeared even to the extent there was source code around. Ultimately, due to the vs. NetROM issues the source for all disappeared. I've misplaced (read that lost) all my source for that stuff. If you have the convers source would you mind sending me a copy. Send it UU'd as mail, via an anon. service if you wish!

It looks like none of the other responders have mentioned that the
ruling does NOT apply to owners of townhomes/condiminiums where the
roof and surrounding real estate is not the sole property of the
owner, but is shared by the group.

If this is the case where you live, the ruling will not help you.

Absolutely. That formula is for the radio horizon over a *smooth*
spherical Earth. It might be somewhat useful in Florida, but the
results it would give for Maine are essentially useless.

Yeah, but Faraday shielding still won't solve the problem you were
blaming on switchers and MOVs. The safety ground still has to be
broken to stop the internal ground runs from being elevated in
potential (and breaking the safety ground, besides being a safety
violation itself, can lead to side flashes during a lightning
strike).

>>Good quality suppression is important. More important is to follow

>wall face where the meter mount is attached, do they?
>
>:)

Actually, single pointing the station is not that difficult. It is
not necessary to locate the station where power enters the residence.
You establish the single point where power and RF (and telco) enter
the station area. You do that with a ground window. Don't just
plug your equipment into any old wall outlet. Take the power through
your ground window *first* (bonding and suppressing as required),
then distribute it to your station equipment through outlet strips
on the *station side* of the ground window. Do the same with every
other cable entering or leaving the station area. Simple really.

You want to bond the ground window to Earth with a good low impedance connection, probably to your tower ground if you have a tower. But even if that Earth connection isn't great, the ground window will still do its job of equalizing ground potentials for all your station equipment, since that's isolated behind the ground window, and that's all that's really essential to keep damaging currents from flowing through and between pieces of station equipment.

It is available at www.fcc.gov. It is longgggg.

This is where I found it after being alerted by the FCC Daily Digest.

Also on the Daily Digest. Recently Centel Cellular was fined $3,000,000.00
for tower violations. Seems that they do not understand Air Safety Zones.
A tower 187 feet high, 2.8 miles from runway, no lights! Did not reply
to FCC for site data. Filed with FAA 5 months after tower operational
for permission to erect tower. What a list of problems. Fine reduced to
$2,000,000.00. After 6 zeros, what does it matter the number in front?

yeah, when they work they're grand. but there seems to be little if any rechecking to see if a url on file at a search location is really there - so you might get 1 of a million possible listings with about 999,000 of them unusuable at all.

of course, there's one location where you have to download files (getting a catalog), expand, run an installation program on the data, then you find you have a bunch of directories and a ton of HTML files to pull up in the browser to view 'em...(now, THAT'S comedy). <sigh>

Have I hit on a sore point?

AA0NN sent me a message that he was deleting my message because he did not like the subject title about what makes a loser. Why are some SYSOPS Tin Gods? They are little wimpy men that are nothing in their everyday life that become Tin Gods here on packet.

Was the Wizard of Oz a ham radio SYSOP?

Of course there are SYSOPs that have self confidence and allow points of view they do not agree with

It appears Mr. Wolfe also is in violation of FCC rules as his address does not correspond with where he is SYSOPing.

>How do I do that?
>Second question.. What Windows/WIN95 Terminal/PBBS programs are
>there?
I can't answer your LAST question, because the 'real computer' (486 dx2 66 mhz is still 'tncless'...i.e. in the bedroom used for 'serious things' like word processing.

HOWEVER... I used to run PAKET (now use TSTHOST...which is MUCH better)on the old DOS machine (IBM AT). You have to write a PAKET SCRIPT to connect to your FBB bbs, and send the appropriate commands (LM RM KM). Of course, before doing this, you have to make sure that the program opens a file to save your mail on your hard drive.

Examples of how to do this are in the PAKET docs.

You can also write a script that will send something you write on your system to the FBB system, if I remember correctly.

Sorry I can't be more specific...but it's been quite a while since I ran that software.

Another alternative is to get a 'real' BBS program...like a old copy of W0RLI (newer versions are overkill) or TSTHOST, which is what I use, and let the software do everything. These programs are DESIGNED to send and receive mail and bulletins, without any scripting. One catch: if you decide to go this route, you will need to be set up BY THE FBB SYSOP as a PMS or BBS so that the FBB system will 'understand' what your system is telling it.

You will also probably be asked to leave your computer and radio 'on-line' at least 12 hours a day...perhaps more...as SYSOPS don't like to waste time trying to forward mail and bulletins to stations that are not on the air...grin.

which just happens to be free to amateurs and that makes it even better.
The latest version is V5.54 (I think).
It is designed to do exactly what you want to do as far as polling your
FBB BBS for messages and bulletins. It allows you to select bulletins
for automatic downloading at preset times, and then read and reply offline.
I found WinPack at this site: http://www.healey.com.au/~vk2yx/

By goom, you're right! I did it the hard way - I noticed Ken Harker had capitalized a V in the middle of one of his sentences. I assumed this was "I" (what other single letter do we capitalize?) and translated (rotated) the alphabet accordingly. Everything fell out nicely from there.

After deciphering "If you can read this, you really ought to get out more," I decided the effort greatly outweighed the rewards!

- Jeff (wrss)

4530. Revised Digital Comparisons

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-08-25 00:00:00 UTC
From: Phil Sussman <pactor@pactor.com>
Message-ID: <322107EE.4A2F@pactor.com>
Source record: 35076

Greetings,

A revision has been completed re: 'HF Digital Comparisons', an article that appeared in JULY QST. Graphs have been redrawn on a common scale and Rayleigh Fading and AWGN conditions have been shown.

See: http://www.pactor.com for the article. To view the graphs merely 'click' on the 'Figiure #' in the article.

Any comments appreciated.

Thanks for reading.

73 de Phil - KB8LUJ

Jeff, you're using the built-in newsreader in the Netcruiser software.
It's crap. Try using Free Agent -- and, if you like it, you can buy
Agent -- and you can do ROT13 with a couple of mouse clicks. Much
more importantly, you can also do most of your Usenet news stuff
offline.

4534. 70 cm deregulqtion in France

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-08-26 00:00:00 UTC
From: Patrick Arnoul <parnoul@gaap.saclay.cea.fr>
Message-ID: <32215B11.73ED@gaap.saclay.cea.fr>
Source record: 35080

Hi there,

I'd like to get your input from abroad about this new fact in France:

Ham-Radio stores are just advertising exciting 433 Mhz HT's that
are PTT approved and to be used without any license nor tax !

The rigs are allowed from 433.050 to 434.790 Mhz and said to be
capable of 5 to 10 Km in open fields (if you happen to know what
that means...).

I guess the opening of this band for non amateurs come from the
previous opening of a few channels for digital modems where the
output power is limited to 10 milliwatts and the antenna should
be attached to the modem box.
The rule says that these devices cannot disturb the other users
of the band thanks to their limited RF power transmitted.

The ad. shows an Alinco DJ-41 (from memory) with an attached rubber
duck antenna and the output power is probably 10 mW which is
capable of 5 to 10 Km line of sight. But I can further check all
this, finding the new text regulating this new Citizen Band.

This band opening to non amateurs made a lot of noise in the French
Ham community, the feelings are diverse, but basically a certain
frustration.

Do you have the same kind of unregulated radio service, I know of
something called GMRS in the US, a 900 Mhz CB in the UK ?

Same here. Dutch government calls them LPD (Low power devices)

* Do you have the same kind of unregulated radio service, I know of
* something called GMRS in the US, a 900 Mhz CB in the UK ?

I have such a device residing at my neighbours house. It's a broadband FM
wireless set of headphones, with the center frequency on 433.500 MHz. Yep
you guessed, the FM calling frequency. A fellow amateur who lives about
6 km away from me could not reach me on that frequency and he sent out 35W of
power. The signal is (of course) way over S9 on my Kenwood TM733e.

Somehow, I doubt if the neighbours really only have a 10mW device.....

The reason for rot13 is not to encrypt a file to keep unwanted recipients
from seeing it. It's just a way someone can post something which can't
be read accidentally. Like posting a joke which someone might find
offensive to a humor group. If someone is just rifling thru the jokes
they won't be offended unless they deliberately decode the rot13.
Another use might be for a post which "spoils" or gives away the plot of
a book or movie.

I had a mentally retarded user who received a message much like the one
you sent here. It was a very derogatory flame to my user's request.
I was able to intercept the message before the boy received that
response.

Since that date, derogatory flames are deleted. The fellow that sent
the message to my retarded user will be forever more on autokill.

Get over it. There are a whole bunch of us out here who agree with
AAONN. The Internet is a much better vehicle for such nonsense. Keep
it on Usenet and you can flame to your heart's content. You can even
send such messages as you did to groups like rec.radio.amateur.homebrew.

My setup exactly. Well... almost. My system uses a three machine
ethernet. I use a stripped down NOS-dos box as a router/tnc (3 tncs)
interface (it's also my repeater controller:), and a second nos-dos
box as a POP/nntp/ftp client/server. The win95 box does most of it's
transactions via ethernet with the nos-dos server. I've tried using
win95 to ftp or smtp directly (via the router) to other hams and it is
marginal at best. It's not too bad on the 9.6K tnc interface, but
hopeless on the 1200 baud tncs.

In my area (connecticut) there is little or no interest in any amateur
networks beyond the 1/2 duplex 1200 baud junk. We have a 9.6K repeater
centrally located with fair coverage and power, but after more than 3
years of operation it still only has 3 users.

From my point of view amateur packet is already dead, we just haven't
buried it yet.

>(sure there have been various TCP/IP implementations with ridiculous
>retry and timeout policies, but now that TCP/IP is not only used on
>local ethernets but also on the world-wide Internet, programmers have
>had to implement more reasonable algorithms)
>
really? News to me. i must be living in a third world amateur
community. JNOS is still considered the top of the line state of the
art.... (nothing against JNOS, 3 years ago it did seem to be filling
the gap.)

The problem is the ham radio digital community in general is totally
stagnate. At least here in Connecticut. At one time i was involved in
the crusade to gather resources and spectrum for ham digital. The
effort was futile and i've since given up. Around here, folks seem
more interested in debating the efficiency of two or three extra
packet header bytes than building networks that work.

Packet here has gone the way of CW. It's cute and fun to fool around with for a while, but as a practical communication alternative for public service or personal correspondence it has little application.

Dear Sir,

In reply to your recent post to a Amateur Radio News group. A couple of notes:

1. Pyramid games are quite illegal. Always have been, always will be. You should be investigated. Your internet privlidges should be permanently revoked, and you buns should rot in jail for the next 8-15 years.

THE INTERNET is not some new vehicle for tired old cons. We wjo use the internet and don't want to see it regulated worry about "holes" like you.

2. No one who reads these groups accept those named "illegal activities" care about your con and wish you would stop wasting space. If you were proud of what you were doing, your NAME would appear in the header instead of some insane name like "MoneyMan"

3. Scum like you are the lowest form of predator in the world, you and all the pedophiles of the world should be the victims of WW III.

Sincerely,

Brian D. McKinley, Ph.D.
56 Church Street
Kingston, PA 18704

4551. Reasons for going to TCP/IP ?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-08-26 00:00:00 UTC
From: Richard Abbot <abbot@pez.bell-labs.com>
Message-ID: <32220A15.2928@pez.bell-labs.com>
Source record: 35097

Hi Folks,

I've been on 2m packet for about six months now. I've gotten a lot of interesting information from the BBS bulletins posted there, but lately I'm not getting the same adrenaline rush from reading about another set of "Drake Twins for Sale."

I know that many people here have gone through some pain to upgrade their 2m packet operation to use TCP/IP.

My question is, "Is that effort worth it?" Or phrased another way, "what new activities does a TCP/IP-based 2m packet operation provide, compared to traditional BBS-ing?"

I work with TCP/IP-based computer networks every day, and I'm very familiar with using telnet, ftp, etc. So, I probably would not get any extra enjoyment from using telnet to connect to another station, in place of the AX.25 "connect" command.

Does running TCP/IP open up any new, fun, possibilities? Or is it simply another way to receive an error-free stream of for-sale notices?

(If this question is covered elsewhere, I'm happy to follow a pointer to the information).

Thanks and 73,

Rich

Howdy Ole, PKGold and KAGold are by Interflex and Jeff has a page on the Web at URL:

http://www.interflex.com/

I use PKGold with my AEA PK232MBX -- fine piece of software.

I disagree!! In June I changed callsign under the FCC Vanity Call Program. I regained my original callsign. One telephone call to InterFlex Systems resolved the problem. They provided me a new registration number FREE! And they were very cordial in the process.

Jon....

Could you detail the "many" problems with KaGold. I changed my
callsign and didn't have to pay any additional charge. I just called
customer support and they updated the registration. I have been
running KA-Gold since the beta version and couldn't be more pleased.
In my opinion,it is the finest multi mode software available.

Ole,
KaGold can be found on the internet at http://www.interflex.com
or you can call them at (714) 496-6639.

Hi all,

Can anyone recommend a brand of 70cm radio from any of the major
ham-radio manufacturers that is really suitable for 9600 baud packet? I
wonder if there are any PLL sets that are satisfactory?

Thanks & Cheers,

Tony vk2tjf

Message-ID: <960826221435630@atdbbs.com>
Source record: 34955

>>The HTX-202 transmits the tone ok but we can not connect or receive.

All I can advise is to make sure the wiring's done properly:

Here's the TNC hook up for the Radio Shack 2m HT:

```
TNC Radio
=== =====

Audio Out -----------||-------------- Tip of Mic plug
C1 |
|
PTT Line ----\/\/\/--------| Ring of Mic (not connected)
R1

Audio In --------------------------- Tip of speaker plug

Ground ---------------------------- Ring of Speaker plug
```

C1 is a 0.1 mfd capacitor of any type, R1 is 2200 ohms.

You mentioned "tones" - does the following seem applicable?

From: KA4NMX@KI4FL
To: INFO@ALLUSA
Subject: HTX-202 TT PAD ADJUSTMENT

Radio Shack has just released an adjustment to the HTX-202 Handie....
It has to do with the PTT tone volume.. It goes as Follows

If you have trouble getting the touch-tones on the HTX-202 2-meter Ham Radio Transceiver (Cat No. 19-1120) to work with the local Repeater, try resetting the unit's touch-tone audio level.

To do this, you can adjust the touchtone pot (RV 1001) down until the tones don't decode, then up again until it JUST works. (Simply tuning down is NOT as reliable as this metho You uld make NO other adjustments!

Also, many repeaters will read back the tones once they decode properly. If you are unsure how to do this, you can find out from another repeater member.

This is all R.S. would have to say about there HTx-202. If you have had any problems with using the phone patch, this should cure it. Some have been setting the << Auto Reply >> function in the main setup to << ON >> to cure this problem. If you have, set it back to << OFF >> before adjusting (RV 1001) pot. Hope this helps.....

73's for now..Russell...Ka4nmx @ Ki4fl

I've owned probably 40 different handheld scanners in the last five years and there is no doubt in my mind that none of the above is the correct answer.

If you can find a pro-43 at a reasonable price grab it. The later ones cannot be unblocked for cellular and I've never owned one of them so I can't tell you much about them but the earlier ones (don't ask me dates) have the best audio, intermod rejection, image rejection, and ergonomics of anything that I've ever used. I've always kept at least one even though I've bought and sold many.

A friend of mine is a radio amateur and he has got this transceiver
radio:
RTX mark ALINCO
ELECTRONICS INC. JAPAN
Portable VHF
model DJ180E

He has got two questions about this radio:
1) How can he modify his radio to extend the band from 144/146 MHz to
130/170 MHz?
2) Can he receive the "manual for use" of this radio? (A photocopy of
the manual is acceptable too!)

For details, please conctact me through my personal e-mail address.
Thank you very much!

In general the multi-mode units - like the Yaesu 736 and others from ICOM
work really well - they use a crystal for the base modulator - you "simply"
couple the TX into the crystal and you are done. They also generally don't
reprogram the synthesizer between tx and rx. There was a review of radios
for 9600 in QST earlier this year - Feb or March I think. Good luck, Dave.

Hi Tony.

I run a Kenwood 451a on 9.6k 24 hours a day. Some will claim this radio
is inadequate for 9.6k operation, and I have not had it on any test equipment,
but it runs flawlesly with my Kantronics 9612 on both, the 9.6k repeater, and
keyboard-to-keyboard.

The only downside is I have to run a 250ms TXDELAY thru the repeater, as the
PLL (of course) "sweeps" a little when switching from the TX freq, to the RX
freq...and vice versa.

Other than that...I like it very much, and it works well.

Take care.

Hello, Folks:

Please note that on September 01, 1996 the Packet BBS Survey on my
home page will be taken down.

I have received many replies from both the Internet and from the
Packet network (about 3 times more from the Internet) and wish to give
everyone a final chance to respond if you have not done so already.

The survey can be found on my home page at:

http://www.trucom.com/ppages/marty

It will probably take a couple of weeks to tabulate and analyze the
data, but the results will be posted here and on Packet.

Thanks!

Yes, I put copies of both bpqdll.dl and bpqcode.386 in the Windows\system directory. I have since heard of other people having the same sort of problems with BPQ and Windows 95.

I have not heard anything about the GRAPES 56k modem project lately.
They were supposedly making the new version available in a kit form
but I see nothing on their web page.

Is this 56Kbaud radio modem project dead ? That would be a shame.

Well, it isn't exactly 'flawless'...

>The only downside is I have to run a 250ms TXDELAY thru the repeater, as the
>PLL (of course) "sweeps" a little when switching from the TX freq, to the RX
>freq...and vice versa.

Oh, you've got a huge PLL settling delay. That *is* a flaw in 9k6
operation. 250mS? I won't use a radio that requires that much
TXD on 1k2. The problem is that a radio with that much delay
contributes significantly to hidden transmitter syndrome, *even on
a duplex repeater*. There's a huge window from the time you
activate PTT until your radio starts spewing a carrier, which
invites other stations to collide with you.

Also, the receiver recovery time means that you'll probably miss
rapid replies, they'll timeout and retry before you get the
frame. This won't happen if other stations are running similarly
long TXDs, but then you're really throwing away the 9k6 advantage
(a 256 byte frame doesn't take much more than 250mS to send; so
a TXD of 250mS represents a loss of 50% of potential throughput).

>Other than that...I like it very much, and it works well.

Um, save up your cash (under $150 for a clean Mitrek and rocks) and get
a radio that switches in 50mS (or less) and you (and all the others on
the same channel) will be much happier.

1996 ARRL and TAPR Digital Communications Conference
September 20-22, 1996
Seattle, Washington (minutes from SeaTac airport)

The 15th Annual ARRL and TAPR Digital Communications Conference is almost here. The 1996 ARRL and TAPR Digital Communications Conference will be held on September 20-22, 1996 in Seattle, Washington. This year's conference location is just minutes away from the SeaTac (Seattle/Tacoma) Airport.

Full information is available on TAPR Web Page http://www.tapr.org

The 1996 ARRL and TAPR Digital Communications Conference is co-hosted by the Puget Sound Amateur Radio TCP/IP Group and Boeing Employees Amateur Radio Society (BEARS).

Not only is the Digital Communications Conference technically stimulating, it is a weekend of fun for all who have more than a casual interest in any of the ham digital communications modes. The ARRL and TAPR Digital Communications Conference is for all levels of digital operators -- a must conference to attend to get active on a national level. Abstracts for the papers are now available on the TAPR web page.

The conference is not just for the digital expert. This year's conference will again provide an entire morning with beginning and intermediate presentations on selected topics in digital communications. Some of the topics will include: APRS, Satellite Communications, TCP/IP, Digital Radio, Spread Spectrum and other introductory topics. Come to the conference and hear these topics presented by the experts! Don't miss this opportunity to listen and talk to others in this area.

In addition to the presentation of papers on Friday and Saturday, three workshops will be held during the conference. Keith Sproul, WU2Z, will hold a workshop on APRS packet-location software. On Sunday, Dewayne Hendricks, WA8DZP , will conduct a workshop focusing on "How to utilize Part 15 wireless Radios for Ham Applications." A second Sunday workshop will focus on Wireless Networking using the WA4DSY 56K RF modem Technology.

Full information on the conference and hotel information can be obtained by contacting Tucson Amateur Packet Radio, 8987-309 E. Tanque Verde Road #337, Tucson, AZ 85749-9399. Phone: (817) 383-0000. Fax: (817) 566-2544. Internet: tapr@tapr.org Web: www.tapr.org

Conference presentations, meetings, and workshops will be held at the Quality Inn Seattle Airport, a complex co-located with the Radisson Hotel Seattle Airport. When making reservations with the hotel, be sure to indicate you are attending the ARRL and TAPR DCC conference. The hotel provides transportation to and from SeaTac Airport. You should contact the hotel to arrange airport

transportation.

>>I am thinking of purchasing a handheld scanner

>>I have been told the following units are quite nice:

>> Uniden BC3000xlt
>> ICOM R1
>> AOR 2700

Currently I have PRO-26, AR2700, and AR8000 handheld scanners. At the street price of around $200, I'd suggest the AR2700 as a best buy. While the RF and audio isn't quite up to the '43's, it's not that bad either. The two features I prefer over the '43 is the attenuation by channel (on all three models) and the computer interface to dump and load the frequencies. I do find the keyboard operation of the 2700 quite cumbersome for a scanner. It's virtually impossible to link in additional banks while drive.

My two cents worth.

>Hi all,

>Can anyone recommend a brand of 70cm radio from any of the major
>ham-radio manufacturers that is really suitable for 9600 baud packet? I
>wonder if there are any PLL sets that are satisfactory?

Use an all-mode (FM, SSB) transceiver. Most of them are quite suitable,
even when it is not listed as such in the ads. Of course you will have
to make a modification in the latter case.
Best is to use a transceiver with a fast transmit<->receive switching
time, e.g. the ICOM IC-475.
When that is over your budget, stick with a Tekk. It performs equally
or better.

In fact standards are lower than that:
The ANSI-95.1,1982, adopted by the FCC in 1985,
limit the peak SAR to 8 W/kg and the SAR averaged over the body to
0.4 W/kg.

For exposure to incident power density, the 1982 ANSI-C95.1
exposure limits are frequency-dependent:
. 1 mW/cm2 at 150 MHz
. 1.5 mW/cm2 at 450 MHz
. 2.75-2.83 mW/cm2 from 824 to 850 MHz (cellular)

Some info on these can be found at URL's below:

Thanks to Joe Pardue for correcting the misunderstanding of facts in the note from "J. Miner" to GM0UZJ now G0UZJ. Users can ask questions of InterFlex Systems by simply sending an e-mail to: support@interflex.com

Programs like PkGOLD and KaGOLD are registered to users, and any user who changes a callsign, or adds one (e.g. MARS call) needs only to contact InterFlex using e-mail, fax, bbs, or phone, and a new registration number is issued as soon as possible, if not sooner!

Also, GM0UZJ has already been issued a new user ID for G0UZJ using the e-mail approach so this entire thread is old news.

Rich has got a point. Anything that is done on the internet can
be done with tcp/ip on packet though abit slower I will admit :) But
that only encourages people to speed up the network by either buying
faster equipment or making faster equipment. Keep in mind these aren't
the only reasons, I will let you think up some of the possibilities.

TTYL,
Mike

Check out "sci.geo.satellite-nav" for information on GLONASS.

4589. HAM-server Information

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-08-28 00:00:00 UTC
From: server@GRAFex.sbay.org
Message-ID: <gate.841299310$114@GRAFex.sbay.org>
Source record: 34901

Distribution: world
Subject: HAM-server information

HAM-server was devised to allow people without direct internet access a way
to get amateur radio related programs and other information. It is not
directly on the internet, so ftp and telnet is not available.

Most of the files on HAM-server are available via ftp from the various sites
around the world that archive them. That's where I got most of them.

In addition to DOS files, there are some Mac ,Linux, and OS/2 files available.
I'm always on the look out for more (particularly Mac, Linux, OS/2).
See below.

General Information:
====================

There is a daily limit of ALL requests of 3-megs. There is an individual
limit of 1.2-megs. If there are a series of files you want to order,
stretch them out over a few days, rather than ordering all at once.
That way, you are almost assured of getting them all, and you won't be
blocking others from getting their orders filled.

ASCII (text) files are split at about 59,000 bytes. UUENCODED binary files
are split at about 750 lines.

A new INDEX is automatically generated every Sunday.

Ordering Information:
=====================

Send an email to:

HAM-server@GRAFex.sbay.org

In the text of the message, place:

HELP
GET /hamradio/INDEX.TXT
QUIT

HELP will send you the HAM-server HELP file. This is processed immediately
for return delivery.

o DOS

If you are using a PC and you do not have UUDECODE, order
UUDECODE.BAS or UUDECODE.C and UUEXE536.ZIP. Compile on your
system then uudecode UUEXE536.ZIP. This is a archive of UUENCODE

and UUDECODE, with documentation. This will work for DOS and OS/2.

o OS/2

I highly reccomend UNZ512X2.EXE. This is InfoZip's ZIP and UNZIP
(plus other stuff). Will dearchive PKUNZIPped files, as well as
UNIX zipped files.

o Macintosh

Most Mac programs are stored in binhex (.HQX). You will need a
utility, such as StuffIt to decode. There are also UUDECODErs
and other de-archivers available. See the index for
/hamradio/macstuff/utility.

o Linux

Use UNZIP.

Some Reasons Why Ordered Files Are Not Received:
==

o If you are ordering from a ccmail system, be advised that ccmail
in its default configuration attempts to automatically UUDECODE
files. If your order is sent in parts, it will hiccup after the
first part. See your system administrator.

o Your return path is incorrect. My bounce mailbox fills up quite
regularly with messages. And, since the path is incorrect, I cannot
contact you to let you know. Try the PING command to check that
the path is open.

o You have spelled the file name incorrectly. Check the INDEX.

o You have entered your request incorrectly. Check the HELP file
for correct syntax.

o The file name has changed since the INDEX was generated. Order a
new INDEX. See the HELP file for the NEWFILES command.

o You sent your order to me personally or in reply to this post.
Orders are only honored when sent to HAM-server@grafex.sbay.org.
That's the way the software works.

YOUR HELP IS NEEDED:
====================

If you have a program you would like placed on HAM-server, you can email it
uuencoded (DOS, Linux, and OS/2) or binhexed (Mac) to

incoming@grafex.sbay.org

This email address is set up to flag me that there is something new that I
need to take care of quickly.

>KE6WED

Gee, Ron, I could spend too much for a 1200 baud link too. Lets see,
$1800 for a FT736R, $325 for a PK-232, $150 for a gain colinear dual
band antenna, etc. What? I don't need to spend that much? Darn right,
and neither did you.

My first 56 kb station broke down like this: $225 for the modem kit,
$90 for a Tiny 2 from PacComm without the on-board modem and fitted
with the KISS56 ROM, $165 for a MMT432S transverter, $15 for new
crystals for the transverter (to fit our bandplan), and about another
$15 for some copper pipe to make a J-pole. Total, $510. Many hams have
that much tied up in the voice radio they use for 1200 baud, nevermind
the cost of the TNC or antenna.

Of course I got the modem kit at the Dayton show special price, ordered
the Tiny 2 special, shopped the flea market for the transverter, etc.
Lets look at an all retail approach using the new 56 kb modem. That's
$345 wired and tested, plus $155 for a Down East transverter kit, and
$125 for a PI-2 card. We'll ignore antenna and feedline costs since
they are common to *any* digital RF link. Total $625. Ok, it's more,
but the new modem has more features; synthesized, signal strength
indicator, full duplex bit regenerator, etc, and it is wired and
tested, ready to use. We could push up the cost of the transverter
if we wanted it wired and tested too, and that'd push us up near
$750, but that's still cheaper than your setup. (Hint, you paid
too much for the transverter.)

As Herr Perot would say, "Here's the deal." The new GRAPES modem
is in the same price range with the PK-232 (which has sold scads),
but the 56 kb modem is 47 times faster. The needed transverter is
in the same price range, or cheaper, than most amateur radios
suitable for packet (barring surplus radios like the Micor).
The only added cost over a 1200 baud station is the PI-2 card.

Frankly, that's money well spent, but you could chop up an old
NCR card (available surplus for $25) as your 8530 card instead.

>>
>> Is this 56Kbaud radio modem project dead ? That would be a shame.

It is not dead. However, there are no more kits, they've all been
sold and no more will be made. All new modems are available only
wired and tested. Both GRAPES and PacComm will be offering them.
I'm told PacComm has 1,000 units in process (they were initially
supposed to be available by Dayton, but got shuffled back in the que
as PacComm shuffled production for another of their products), and
GRAPES should have more on hand soon as well. I played with one of
the first of the new units, it's neat, and currently have one of them
on order for myself. I'll have one of the older modems for sale after
the new one arrives.

> 73 karel

Yes, I have put both bpqdll.dll and bpqcode.386 in the windows\system directory. BPQ does start up ok, but crashes a few minutes later, taking the whole system down with it. (It all worked ok under Windows 3.1)

You have to load BPQCODE in your autoexec.bat, so before Win itself is
loaded. Also copy the file BPQDLL.DLL to the SYSTEM-directory of
Windows.

>above figures. That reduces the safe distance for controlled exposure
>to just 1.38 meters, and for uncontrolled exposures to 3.15 meters.
>That's much better.

Although the FCC report and order says nothing about the near field
problem when calculating HF limits, IEEE C95.1 1991 says in a 'note'
to the tables for controlled and uncontrolled that the MPE is the rms
E and H limits given in the tables. Thus, IEEE C95.1 1991 essentially
tells you to use the far field values. In the case of your isotropic
example that uses 100W ERP, E= 1842/f or 61.4V/m and H=16.3/f or
54A/m for controlled exposures. This yields a radius of .89m for E
and .27m for H (whether near or far field). For uncontrolled, E
=823.8/f=27.46 V/m and H=the same as for contolled = .54A/m.
This yields radii of 2m for E field in uncontrolled and the same .27m
for H in uncontrolled.

Note that when doing the power density calculation, f**2 should be
used, not "f". When calculating power density for the 3-30MHz range,
the power density is the same E field 1mW/cm**2 mentioned on the ARRL
website. The H field power density limit is 10000/f**2 or
11.11mW/cm**2 for controlled and uncontrolled. You will obtain the
same radii for E and H using the "S" for E and H (power densities)
column as you do when using the E and H field columns in all cases.

Using the isotropic antenna at 100W ERP, the standard tells you to
stay .89m away from the isotropic antenna in controlled environments
and 2m away from uncontrolled environments. With a real dipole type of
antenna, the hotspots will be the feedpoint (H field) and the

endpoints (E field). Theoreticaly, the distances should not exceed the worse case example of the isotropic antenna. When adjusting for 1000W ERP, the radii do not increase by 10 because it is a SQRT relationship, so the distances are not as high as one might initially think.

Although the calculation is easiest to make on an isotropic antenna, I have not been able to find or build a good one ;)

Good reply Steve. Who is trying to control who here? If someone tries to control what my BBS transmits by telling me I have to forward a message I object to they are censoring me. Now, the FCC has the authority to tell me what I must transmit (my station callsign for instance) and what I must not transmit (a message in a secret code for instance). Aside from that I control what is transmitted under my callsign. When you tell me I must relay a message from someone else that I find stupid, useless, too long to be reasonably relayed, or otherwise objectionable you are the one who is playing "tin god," not me.

In doing this, I am not censoring you. You can transmit from your station whatever you please, so long as the government, which issued your license, doesn't object. You can send recipes, FCC Updates, flames, debate bulletins, jokes, whatever. I am not censoring you. Be happy, knock yourself out. Just don't tell me I have to relay it for you from my station. This is a free country and I have the freedom to refuse to be controlled by you.

See folks, it is easy, once you who is trying to control who!.

I agree... The 56Kbps would be a good compromise between speed and
simplicity, especially when coupled with your ideas for the HF links
below...

>Except in special circumstances, I don't think it would be wise
>to require a rigid topology for our local nets. Stations should
>be able to drop in and out at will without adversely affecting

To a point, I agree here as well. I can see many of the more rural (ie
less populated) areas needing to have a fairly rigid design. For
example, here where I live, we have distances in the 30-50 mile range
between nodes... If one station drops out, we have 60-100 ranges to
cover. But, as you say, this would be a special circumstance.

>LONG DISTANCE NETS:

I'm not familiar with Piccolo... Need to look that one up for some
additional reading. Seems that the prices I have seen for Clover make
that somewhat prohibitive for many folks. What could be done to lower
the costs? More users (ie increase the demand)? Homebrew/kits?

>If we were allowed to occupy a 3 kHz data channel, we could stack in

I have been thinking about the use of SS systems at HF. Other than
regulatory issues, I can see no problems. Well, no technical
problems... I suspect that there would be a HUGE fight to get SS on HF
due to the lack of understanding of SS by many HF users.

>But Clover isn't packet, nor does it have the overhead

You're right, Gary... I have not done the calculations. All I am
saying is that this is an option. It may or may not be doable in
practical terms. It would, however, be the ideal.

>Down low, a LEO for T1 rates would still be pretty big (due to the

>much less to build as well. A Microsat (2 kg, 10 watts total power

>budget) costs about $10,000 while P3D (450 kg, 500 watts total power
>budget) will cost about $2,000,000. Therefore, most of AMSAT's
>efforts up until the P3D push have concentrated on Microsats. There's
>no way in hell that a Microsat can do T1. Doing P3D has pushed AMSAT
>to the limit, and drained most of the long time workers. We're going
>to be lucky in the post-P3D period to find the resources and talent
>to just get some more 9600 baud Microsats in orbit.

Just as an aside, what would be the highest speed available on a
Microsat? Would 19.2 be possible/practical?

>(Note, P3D has two experimental 56 kb channels. They may or may not
>work due to the thin link budget. There's a fallback to four 9.6kb
>channels in that case. 1200 baud PSK will probably work through the
>analog transponders, using fairly ordinary Oscar class stations, but
>since they're continuous carrier, such use of the analog transponder
>will likely be considered poor practice.)

Should be an interesting experiement if nothing else.

>Gary

Again, thanks for your comments, Gary! You have, as always, provided
some good food for thought!

Les,
I haven't heard anything about the kit either. The problem with the 56k
modem stuff is it is exceedingly expensive. I've got over $2000 invested in
just one half duplex link (figure $250-$350 for the modem, $580 for
transverter, $100 antenna, $125 PI2 card all times 2). If the thing could
get down to $500-$600 it would be much more attractive. As it is, I doubt
it if will ever be prolific.

I never said that I was using voice radios... The TEKK was, in my
cases, not only perfectly suited for the application, but it also was,
as you stated, much cheaper than a voice rig. Again, the important
fact is that the TEKK radios _work_!

Also, anyone ever work with one of the modified TEKK radios for 19.2
Kbps?

>>>On amateur radio, the only practical way to get long haul hops is

>however, and we need to take that into account in designing our
>networks.

OK, Gary, you have convinced me (more or less) that we should be
looking at very fast local links and fast long haul links. The exact
definitions of "very fast" and "fast" still need some work...

>A purely amateur World Wide Web is out of the question. We have to
>develop a different paradigm. Our data flow needs to be mostly
>local. We need local caches. We need to fully exploit distributed
>processing on a model inverse from the web. (In fact the web itself
>is going in that direction with things like Java applets.) We need
>to minimize the traffic required on the long haul links while
>maximizing local processing.

Let me just toss in here that while I agree with your concept, I want
it to be very clear that I am opposed to anything that limits the
traffic types that can be sent. That is, there are those that oppose
some of the bulletin traffic (ie DEBATE, SALE, WANTED, RECIPE, etc.)
and there seems to be a fairly good sized group of US SysOps not
passing @WW traffic. In other words, I think that the network needs to
grow to support the traffic and not for the traffic to shrink to fit
the traffic.

>Several years ago now, before the web, and before Java, I called for

>Of all people, Wayne Green supplied the spark for this idea. He wrote
>an editorial about using message dictionaries to speed up communications.
>At the time, I was designing a TIL, and the marriage of paradigms came
>naturally. A TIL is nothing but a cascaded dictionary structure, recursively
>defining itself until it reaches an execution level.

Amen! As you say, Gary, this is not a new idea... Back in the "Good
Old Days" this sort of thing was done in many applications (not just
telecom) and has proven effectivness. It seems that we try to reinvent
the wheel everytime we send a message on packet!

>Gary

Thanks!

>Well I wouldnt call it a "flaw"...I think what you mean is "unacceptable". And
>it should be noted, that referes to you...not necessarily anyone else.

I don't want to argue semantics. Sure, you can say that your radio
isn't flawed, it just isn't as good as that Dana Myers says it should
be, but that's just Dana Myers for you. If that makes you feel
better, fine. The fact is, a TXD of 250mS on 9600 is a flaw, and that
isn't just my opinion.

>>250mS? I won't use a radio that requires that much
>>TXD on 1k2.
>
>Fine...again...those are your standards, and you should be comended for keeping
>such high standards, but the fact is...most folks use 200 to 350ms TXD @ 1200
>bps.

Most folks? Most folks I know are using less than 70mS. Maybe most
folks you know are using flawed radios, too. 50mS TXD for 9600 baud
is not a high standard.

>>The problem is that a radio with that much delay
>>contributes significantly to hidden transmitter syndrome, *even on

>>a duplex repeater*. There's a huge window from the time you
>>activate PTT until your radio starts spewing a carrier, which

>the PLL lock takes less than 250ms...it is set there to allow a buffer. But you
>are correct about the collisions, however, collisions can happen even with
>rigs set at 50ms.

Of course collisions can happen with rigs set at 50mS. In fact, collisions
can happen with rigs that have a TXD of under 5mS. The probability of
a collision is increased with increased transmit delay time.

>>Also, the receiver recovery time means that you'll probably miss
>>rapid replies, they'll timeout and retry before you get the
>>frame.
>
>True, but I have not experienced that problem. Granted there are not a lot of
>users on 9.6k in our area, but all of my operation has been solid, with no
>retries.

Well, if everyone in your area is running 250-300mS TXD, I doubt you'll
see replies quickly enough for your receiver to miss them. How
do you actually know your operation has been solid with no retries
by other stations?

>>This won't happen if other stations are
>>running similarly>long TXDs, but then you're really throwing away the 9k6
>>advantage>(a 256 byte frame doesn't take much more than 250mS to send; so

>paragraph per transmission. The difference between 1200 and 9.6 on my station
>is obvious.

Sure, using large block sizes reduces the overhead. Using a radio
with an appropriate TXD is even better. Radios slow to key up
on frequency increase the odds of collision, and the longer frames
increase the impact of a collision when it happens.

>>Um, save up your cash (under $150 for a clean Mitrek and rocks) and get

You're taking this far too personally. Did I criticize you? No. I
pointed out some of the problems with using a PLL radio for 9600 baud.

The Pro-39 is another excellent scanner that can be unblocked for cell.
The mod is more difficult on the Pro-39 than on Bearcats, but the sound
quality is much better.

>Anyone had experience with this type of radio on packet?

>Sam K3BY

I have a Baycom and have had similar problems. Also, a friend of
mine has encountered troubles with the Baycom/HTX-202 combination.

My biggest problem is *rejected* packets and long connects. Like
you said, it appears that the Bay has a problem receiving. I have
noticed that the higher the modulation of the station you are trying
to connect to, the harder it is to get good packets. One of the
stations here in Tulsa has incredibly low modulation, and I almost
never reject packets from it (figure that one out). On the other hand,
my neighbor runs a fairly high modulation, never has problems connecting
to anyone (he owns an MFJ), and cannot communicate with me!

If there's anyone that has solutions to this perplexing problem,
I would sure appreciate any guidance. Right now, the Baycom
is setting in the box not getting used.

4612. Re: GRAPES 56K modem , is it dead?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-08-29 00:00:00 UTC
From: Ron Curry <recurry@insighttec.com>
Message-ID: <01bb9576$a6d0c540$5ba19ecd@expressp5.insighttec.com>
Source record: 34908

Well Gary you sound like a guy who knows a lot of stuff but please allow me to enlighten you a little. . ..

First of all you got a good deal on the transverter, I applaud your ability to find such good deals. Unfortunately, MMT hasn't made the transverter you speak of for several years and there aren't many around. Even so I've had opportunity to buy one or two on the used market for around $200-$300 (gee never saw one for $165). That wasn't the issue however. Maybe in Lawrenceville, GA you've got lots of spectrum in the 420-450mhz ham band just begging for a 70khz wide signal. Gary, not everyone lives in Lawrenceville, GA. In the San Francisco area and other major cities the 220mhz and 70cm bands are chock full with voice repeaters, ATV and 1200/9600 baud packet so the only choice is to go up. (Actually there is some 219 mhz space for point to point links but not high level omnidirection installations) 432mhz and 220mhz transverters are basically boat anchors around here for data use and I would give you maybe $50 for yours. Soooooo that means a double conversion (28-144-xxx) to get to 900mhz or 1.2ghz where there is some open spectrum.

These transverters are not cheap nor are they plentiful on the used market. It is unlikely that one just finds this stuff at the "flea market". I go to two of the biggest flea markets on the West coast every month and I've posted WTB on rec.radio.xx.xx many times. It just ain't common stuff Gary. I ended up buying mine from Down East Microwave. I am building the next set myself with PCB's from DEM but I happen to have signal generator, spectrum analyzer, etc and the knowledge to make it work - this is likely not a solution for most hams AND it isn't that much cheaper. If you want to play high bandwidth in the major cities you've got to go up and the transverters are not cheap. Unfortunately the demand is not high and the vendors are few so the prices stay up there.

You mentioned a "Tiny-2" TNC for $90. What is the realized throughput? The Kantronics Data Engine has a V40 (8088 like) 16 bit processor and even it can't feed a GRAPES modem at the full data rate nor can it accept it. We also tested a Paccomm Spirit-2 and it couldn't keep up either. We did some testing with a modified TNC-2 clone but got less than half the effective throughput of the PI2 cards . The Tiny-2 TNC serial port is only 38.4k (from Paccomm specs). Maybe you have a mod it to make it go to 56k (do you?) but then it only has a 4.9mhz Z80 8 bit processor (unless you upgraded it). Based on our testing it is almost certain you are not getting anywhere near the full bandwidth of the modem. If you are and you have real data to prove it I'll be very eager to hear it because this could be a alternative to the PI2 cards! Also if you are using mechanical T/R switching, as I recall the MMT transverters have, this is a HUGE performance hit. The transverters we are using have PIN diode T/R

switching. The PI2 card is priced less than most TNC's anyway.

You must have a very low noise floor, be relatively close proximity to the other stations(s) or live in a flat area if you get good results with a J-pole. Unfortunately, we found multipath to be a big problem (even on the low end of 70cm where we did some testing with some borrowed transverters). The GRAPES modems are negatively impacted by multipath distortion. This is a problem most anywhere except flat areas unless you are close proximity or using lower frequency. Aside from the fact that with only 10 watts out of the transverters we needed more gain, yagi's helped the multipath problem immensely and really don't cost that much. I too have a homemade J-pole. I use it for 1200 baud packet on 2m.

We are trying to put together a network here which will hopefully attract more than just a few of the most technical users. Most (almost all) are not inclined to build anything other than cables so we are testing solutions that can be had off-the-shelf. Yes, you can throw together a GRAPES based 56k data link just as most hams throw together their 1200 baud links. Especially now that you can buy the Paccomm fully assembled. What will the performance be? Yes, one can scrounge and dig at flea markets for used equipment but despite your insinuation that you are smarter than I for going it on the cheap you haven't discovered anything new here. I buy lots of stuff at the flea market and on the net but it is not the answer for everybody - especially when it comes to less common equipment.

So assuming your Tiny-2 solution does enable the full capability of the GRAPES modem (or at least most of it). What would it cost if you couldn't buy it used? Here are the prices direct from Paccomm and DEM which assume you have 70cm spectrum: (I have no idea where your DEM prices came from. I just got off the phone from Steve today and they are much higher than you state)

Paccom 56k modem $349 + shipping
(No choice can't buy kit)
Tiny-2 w/10mhz option $174 + shipping (is KISS extra?)
(Sorry, they don't sell it as a kit)
DEM 432-18 transverter kit $335 + shipping ($435 for assembled)

I get $858 not including shipping OR the antenna and $958 if you buy it assembled. OK, so you'd rather use a PI-2 card - make it $800 + around $30 in shipping.

Now Gary, if you can't get a frequency on 70cm and must go to 33 or 23 cm:
Paccom 56k modem $349
PI2 kit $125
DEM 902-144 or 1295-144 kit $295
DEM 144-28DC kit $159

I get $1087 and that's if you build the transverters yourself from kit. Buying bare PCB's and scrounging parts doesn't save much. This what we need to use here.

All of these transverter prices are for relay T/R switching which WA4DSY will tell you is not recommended to add another $50 to the transverter price for that.

Anyway, one can piece together used gear because it is cheap, even though it may be sub-optimal but it may meet your expectations. One can build the stuff themselves but it is really more for the satisfication and challenge then as a money saving mechanism. The bottom line is the stuff is expensive. I'm glad you were able to build something out of bit's and pieces you found at the flea market - hope it meets your expectations. Let me know if you find any good deals on 903 or 1.2ghz transverters!

Cheers,

Ron Curry

>keyboard-to-keyboard.

"I have not tested it but it runs flawlessly". This is the comment that you see from many commercial-FM-transceiver 9k6 users. Often referring to a claim from others that it is inadequate.

However, please not that the vast majority of people who DID test it, will tell you it IS inadequate.

>The only downside is I have to run a 250ms TXDELAY thru the repeater, as the
>PLL (of course) "sweeps" a little when switching from the TX freq, to the RX
>freq...and vice versa.

That downside would be sufficient for me not to buy it. And it should be for you as well.
You are causing QRM on nearby channels with that sweeping transmitter (which is a design problem that plagues ALL Kenwood TM-[2345][34]1 transceivers), and the long TXDELAY cuts into the efficiency of the channel.
You share the channel with everyone else, so you should be considerate.

>Other than that...I like it very much, and it works well.

You have not tested it. How would you know?

Hello,

Have anyone information about programming the Kenwood TH-79E with your computer ? . I can't find any information how do do this.

I know it is possible because there is a programma called "EZCLONE" whichs can programs your portable rig.

1) What kind of hardware is required ?
2) Where can I found information how to programs my portable rig. I couldn't found anything in the manual or the Website of Kenwood.

Hmm...

Sounds like the typical packet burn-out experienced by most reasonably
intelligent folks who might have had expectations that packet was more than just
a coast to coast forsale listing.

If you live in an area that has nothing but 1200 baud links, and bbs freaks i
doubt that tcp/ip links will have much going on that will hold your interest.

On the other hand IF your area has a few 56K connections and some 9.6K user port
connections you might have some fun with tcp/ip. Email is nice, and there are a
few useful nntp servers on the amateur links.

Check with the local guys using it. What servers are there? nntp? pop? http??
What are the links speeds? What is the coverage area? What modem do you need to
connect? (if it's 1200 baud don't even bother!) What gateways/proxies are
available?

If you ask questions like these and the answers are something like the ones i
got ..."duh, duh, we use tcp/ip...." I'd forget it.

I disagree. I just dont agree with your teminology I guess. I would say
that ny setup works flawlessly with its given settings. Now those SETTING
may be "unaceptable" to you (and others), but I was simply answering the
persons question...which is YES...there ARE PLL radio that will work at
9.6k.

BTW, that was the setting for duplex operation. I can run 100ms in simplex.

>Most folks? Most folks I know are using less than 70mS. Maybe most
>folks you know are using flawed radios, too.

No...I know of no one on packet that is useing a flawed radio.

>50mS TXD for 9600 baud
>is not a high standard.

That may be true, but the average TXD in my neck of the woods is much higher.

>Well, if everyone in your area is running 250-300mS TXD, I doubt you'll
>see replies quickly enough for your receiver to miss them. How
>do you actually know your operation has been solid with no retries
>by other stations?

By monitoring the frequency of course.

>You're taking this far too personally. Did I criticize you?

Did I say you did? :)

>No. I
>pointed out some of the problems with using a PLL radio for 9600 baud.

And I answered the guys question which was "...if there are any PLL sets
that are satisfactory?" The answer was yes...and I also added some information
and settings so he could get the whole picture, as not to cloud the issue.

Take care Dana, and thanks for the feedback.

"Inadequate" in what way?

>>The only downside is I have to run a 250ms TXDELAY thru the repeater, as the
>>PLL (of course) "sweeps" a little when switching from the TX freq, to the RX
>>freq...and vice versa.

>That downside would be sufficient for me not to buy it. And it should
>be for you as well.

Well...I certainly wouldnt pass judgement on others what to buy, but lets not
forget...everyone has to start somewhere.

>You are causing QRM on nearby channels with that sweeping transmitter
>(which is a design problem that plagues ALL Kenwood TM-[2345][34]1
>transceivers), and the long TXDELAY cuts into the efficiency of the
>channel.

With the deviation set correctly (3.0), it does not sweep outside the 5khz
limit, but I agree that "long" TXDs affect channel effeciency.

>You share the channel with everyone else, so you should be considerate.

I run the same TXD as most users on the freq.

>>Other than that...I like it very much, and it works well.

>You have not tested it. How would you know?

It works well in the regard of solid connects, and no retries with other
stations, and when on the 9.6k repeater, results are the same.

Take care Rob.

How did you remove the comms drivers? The best way to do it is to set up
a Win95 hardware profile with the com ports used by BPQ removed. I find
that works totally satisfactorily.

>persons question...which is YES...there ARE PLL radio that will work at
>9.6k.

Sure, there ARE PLL radios that are acceptable for 9600 baud. Your
Kenwood just doesn't happen to be one of them.

A short analogy:

If you had a car that could only maintain a top speed of 35MPH, would
it be a good idea to driver on the 70MPH interstate? I guess if
everyone is driving 35MPH on the interstate, it wouldn't matter.

>BTW, that was the setting for duplex operation. I can run 100ms in simplex.

Are you saying there's a local duplex repeater that requires an
extra 150mS of TXD? That repeater is quite broken.

>>Most folks? Most folks I know are using less than 70mS. Maybe most
>>folks you know are using flawed radios, too.
>
>No...I know of no one on packet that is useing a flawed radio.

Um, if that repeater you're using requires 150mS of extra TXD, it
is flawed.

>>50mS TXD for 9600 baud
>>is not a high standard.
>
>That may be true, but the average TXD in my neck of the woods is much higher.

In other words, most everyone you know is using flawed radios and
doesn't realize (or accept) it. That doesn't change the fact - these

people are using excessive TXD.

>>Well, if everyone in your area is running 250-300mS TXD, I doubt you'll
>>see replies quickly enough for your receiver to miss them. How
>>do you actually know your operation has been solid with no retries
>>by other stations?
>
>By monitoring the frequency of course.

Which receiver are you using to monitor the frequency? Do you have
a separate receiver set up with monitoring software (like AXMON?).
You can't use your station receiver for this kind of monitoring
since it won't hear the packets being dropped that are later
retried.

>>No. I
>>pointed out some of the problems with using a PLL radio for 9600 baud.
>
>And I answered the guys question which was "...if there are any PLL sets

There are PLL radios that are satisfactory, but then you added some
information and settings which clearly indicated the one you're using
is *not* satisfactory but you use it anyway. Then you explained that
everyone else in your area is using unsatisfactory radios.

Source record: 34917

Hi Ron,

I don t think the GRAPES modem is dead, but I ve also made comments that there is an extra 300 dollars fat in the line up to make a 56 KB DSY signal at 10 to 20 watts.

I think allot of it is due to the transverter. But, for the money, the demod should have a coherent/non-coherent mode.

The higher u go, the more expensive the trasverter approach gets. A better way to go is with a I/Q radio, at 440 and higher. And these days, there are even chips to do most of the I/Q radio.

Does the newver version of the DSY modem have I/Q outputs? If this is so, there s still hope, with this round of updating. If not, U might be right!

Scott,

There is no charge for KaGOLD or PkGOLD tech support, callsign changes, additional callsigns (M.A.R.S., C.A.P., etc.) nor for replacement disks. Updates are presently $20 for owners of version 9. Updates cover Win 95 enhancements, Win 3.xx, NT, and OS/2 support, "The 1996 Radio Amateur Callbook" GTOR Monitoring (version 8 ROMS for KAM), and a few other changes to support newer ROMS from both AEA and Kantronics.

For info: contact "support@interflex.com"

Also, visit http://www.interflex.com

Thanks

Jeff

The best radios for 9k6 I tested and used are Kenwwod TR-851 and Yaesu FT-736R.

The worst is Kenwood TM-733 ! This latter has a 'dedicated port' ... :-(

Ciao !

>
>Can anyone recommend a brand of 70cm radio from any of the major
>ham-radio manufacturers that is really suitable for 9600 baud packet? I
>wonder if there are any PLL sets that are satisfactory?

There is *one*, Tony. It is the Azden PCS9600D. However, I can't
recomend it since Azden has a horrible reputation for poor reliability
and lack of factory support. The Icom IC820H almost makes it, but the
receive filters are too narrow. If you can fit wider filters, it may
suffice. (It's not that 9600 is wide, it is just that filters are phase
non-linear near the passband edges and that distorts the signal and
closes the eye. The cheap way to fix that is to use a wider filter so
the signal doesn't approach the passband edges. The expensive way is
with an adaptive equalizer.)

Otherwise I suggest you stick with a crystal controlled data radio
like the TEKK KS900. It works fine, and costs very little (under
$150 crystalled to your frequency). It is rare to need frequency
agility in a data radio anyway. The proper way to configure a
network leaves your radio on a single known frequency 7x24 so
that the network routing software knows where to find it when
there is traffic for your station.

Hi all. Is anyone currently running the FT-8500 with 9600bd packet? What I'd like to know is how fast is the T/R switching on this radio? Would it be capable of coping on a network using TX delay paramaters of, say 20mS max?

Any info/feedback on this greatly appreciated.

Cheers,
Rod VK5ZTV.

Ouch. Isn't it hard enough to keep a repeater running reliability without burdening it with the additional instability of a typical PC? I'd only recommend this for a "toy" repeater set up in your spare bedroom; for a real repeater site, by the time you add enough shielding to the typical broad-band noise source PC, and in turn protect the PC from a high RF environment, and get some kind of decent interface board built that won't blow up the first time there's a thunderstorm, and patch the BIOS so that the PC won't sit there waiting for someone to press F1 on the (non-existent) keyboard when it boots up....etc., etc.

I'd sooner roll my own controller from a Z80 or 8088 and a few parts than try to adapt a PC to this application.

Many people think PCs are suitable for real-time process control...they are mistaken. There are very good reasons why a PC is $500 and a real controller is much more; and building your own repeater controller out of a PC is a very good way to find out why.

If you are still sure you want to try this, there's a block diagram of the functions a repeater must have in the ARRL handbook (recent editions); its all pretty straightforward to implement in software, though you'll have a devil of a time making it bulletproof.

Good luck,

Bill

This is exactly the problem I had trying to develop solutions using
the MS stack with other slow wireless networks, like CDPD. The
timeouts were awful. The response I got from the MS developer? Tough
luck buddy.

That is why I gave up on my Win95/WinNT driver for AX.25.
(NT uses the same code base for its IP stack, BTW).
I didn't think it would be worth it, and I could see the support
nightmare when everyone started to use it.

However, there are wireless friendly (slowlink) stacks on the market.
However , you must pay additional money for them.

I think the easy way is to have an old 386 running NOS with a NIC
card, and have it do the routing to your Win95 machine, or run Linux
on your machine and set up the AX.25 stack and utilities. (That is
what I run, and it works just fine.)

Jeff

Can anyone who has used both or knows quite a bit about this stuff
tell me what I dont get with a BayPac BP-2M. It is tiny, uses no
external power source, has lots of features and costs only 70 bucks.

Why would I want a KPC-3 over this unit. I dont know anything about
packet but a lot about computers and would like to combine my work/hobby
with my hobby(amateur radio).

For packet I am particularly interested in satellite pictures like WeFAX
and learning about TCP\IP over packet. I am planning on using a packet
controller with an HT and a desktop computer and later a portable computer.

Any info is greatly appreciated.
TIA

I have a TR-2600, and I was interested in knowing why it always had a
'click' on the transmitted audio at keyup time. I noticed the click
was audible on nearby frequencies, too, and suspected the PLL
settling was to blame.

So, I connected the discriminator output of a test receiver to a scope
and tuned it 100KHz away from the HT's transmit frequency. Guess what?
I could clearly see the HT sweeping through the passband on key-up.

So I tuned 200KHz away. Same thing.

I estimated the HT was swinging about 300KHz on the initial overshoot.

That's a lot.

Interestingly enough, the PLL in the TR-2600 does have a lock detect -
it just isn't very picky about how locked the PLL is. It is really there
to avoid transmitting when the PLL is completely failed.

The sweeping PLL plagues most early PLL radios. We have a documented
case in New England where a TR-2400 (early Kenwood PLL handheld) trashed
a node 20 miles away every time it transmitted. I have seen a PLL sweep
across a channel 300 KHz away 3 times during the pre-lock period.
Fortunately most modern PLL radios do not transmit until the PLL is
locked. That creates another problem. When a radio has a delayed power
out period, nobody else on the channel will know that it has started it
TX sequence. Result a collision, either yours or somebody else's. Read
my article on "Key-up HTS" at http://www.cam.org/~dino/neda/HTSDUAL.html

>
> With the deviation set correctly (3.0), it does not sweep outside the 5khz
> limit,

Deviation is not the problem, it is the PLL sweeping across the band before locking up. Such a moving signal if it is being transmitted at significant power will punch holes into frames on any channel within RF range. It only takes 0.1 ms of hole to completely trash a frame. See above for documented case.

> but I agree that "long" TXDs affect channel effeciency.

They sure do. What is the point of sending 250 ms of flags and a 15 ms ACK frame? That is a lot longer than a 20 ms TXD "fast" rig with a 120 ms ACK frame at 1200 bps. I suppose if you send a long enough TXD period then everyone else will have given up and you have a clear shot at the channel. :-)

>
> >You share the channel with everyone else, so you should be considerate.
>
> I run the same TXD as most users on the freq.

You should be running the minimum TXD that your radio and the radio at the other end of the link require. That would reduce the surplus flags being sent on the channel and reduce the chance of a collision with a HTS station.

BTW the Flexnet system being used in Europe has an interesting feature. The node measures the length of TXD transmission it can hear from you and if it hears more than 100 ms it will send you a msg indicating you have your TXD set too high. It then refuses further data from you. You only need enough flags so that the station at the other end of your link can catch the start of the data frame.

> >>Other than that...I like it very much, and it works well.

Ignorance is Bliss!!!! And no excuse for running inadequite radios on the network.

>
> >You have not tested it. How would you know?

For test methods to check switching speed of radios, try http://www.rocler.qc.ca/burt/drstm.html

>
> It works well in the regard of solid connects, and no retries with other
> stations, and when on the 9.6k repeater, results are the same.

Anyone who says that he has NO collisions on a channel must either:
A/ Be transmitting UNPROTO frame alone on the channel or
B/ Be so strong into the server that he overrides everyone else on the channel or
C/ Would not know a collision if it hit him in broad daylight in the middle of the highway.

Any communications involving 2 or more stations on a CSMA channel will encounter collisions. Just like the only 2 cars registered in the whole

state of Ohio in 1905 that had a collision one day. I presume that you mean you have very few collisions. If so, say it. Give it some numbers like 5%, 10% or whatever. More likely if you are not having collisions then others on the channel are due to your signal.

>>Kenwood just doesn't happen to be one of them.
>
>My Kenwood is running right now...as we speak...at 9.6k. :)

I've never claimed that your Kenwood can't spew bits at 9600 baud.
What I've claimed is that your Kenwood is not suitable for 9600 baud
operation because of the excessively long TXD value you claim to use.

>>>BTW, that was the setting for duplex operation. I can run 100ms in simplex.
>
>>Are you saying there's a local duplex repeater that requires an
>>extra 150mS of TXD? That repeater is quite broken.
>
>No.

You've said you use 250mS TXD when operating through a duplex repeater, but
that you only use 100mS in simplex operation. Why do you use the longer
TXD when operating via a repeater?

>
>>Um, if that repeater you're using requires 150mS of extra TXD, it
>>is flawed.
>
>Er...I dont know where you got this idea.

I can do math - you said "250mS on the repeater, 100mS on simplex".

250-100 = 150.

>>>That may be true, but the average TXD in my neck of the woods is much higher.
>
>>In other words, most everyone you know is using flawed radios and
>>doesn't realize (or accept) it.
>
>No. And Im not sure why you continue to make rash assumptions.

You've said you use a TXD of 250mS and that everyone else uses a similar
TXD. That's broken at 9600 baud.

>>That doesn't change the fact - these
>>people are using excessive TXD.
>
>As always...your opinion is welcome Dana. :)

It isn't just my opinion, Chris. Ask someone like Kantor or Janssen
or Coffman (you know, other people with networking and packet experience).
The answer won't be that different.

Don,
I don't think it's dead either. I hope I didn't come across that way. It will just float along like it has for the last 8 years until there is a reasonable price for the transverters and interface card (actually the modem shouldn't cost what it does either).

I don't believe the new version has I/Q outputs. I'd have to call up WA4DSY's home page to look since PacComm only give you a stapled 3-4 page "how to hook it up" photocopy with no technical data.

What is with the patronizing attitude?

Someone asked if PLL radios are suitable for 9600 baud.

You authoritatively answered "Yes, my Kenwood works flawlessly".

Several people disagreed with you, and you argued with them, continuing
to claim your radio works flawlessly.

No one, certainly not me, is saying people should start out with the
very best equipment possible - that's your own red herring argument.

If someone is starting out, they're best off if they select the
equipment that works well with a minimum of fuss. This doesn't
mean they have to spend a lot of money - a Tekk radio sells new for
something like $100 and is ideal for 9600 baud, but a fancy
Kenwood sells new for something like $400+ - but it does mean
they should practice some care in the selection of equipment.

There's really no need to become patronizing, Chris.

I need an opinion. I recently purchased a KAM + and am looking for the best software for integrating it into my shack. I hear that KAGold is good, but there is also Hostmaster II+. What is the best to get ???

Gee, Chris, all this time I thought this was AMATEUR radio. Sure glad we got
these PRO's to help us out. I guess I better not tell them I am using a ten
year old radio on 9600 baud packet, I might get reamed too.

73, Jim KH2D

4643. www.hamradio-online.com is now read in 43 countries!

With perhaps the widest distribution of any amateur radio "magazine" in the world, www.hamradio-online.com is now being read in 43 countries around the globe. And its free, self supported by us and you, our readers who contribute great feature stories for this online magazine.

If you haven't paid us a visit, please stop on by and have a look around. There's lots to see - from feature stories all the time, to real-time propagation conditions, auroral conditions, meteor scatter info, disaster situation reports, newsletters from amateur organizations throughout the world, and our vast library of nearly a year's worth of online articles. And we allow reprinting of almost everything in club newsletters and other non-commercial publications and web sites (please see our reprint policy, online).

And watch for more cool stories and new features over the coming months. We already have a great line up of stories for September and October - and we plan to add some neat Java-based features as well.

> without burdening it with the additional instability of a typical PC?

Not true. The repeater that I'm affiliated with, is hosted by a PC
clone motherboard. The hardware and software has been very reliable.
The only failure has been a hard-disk (which is only used for logging).
If we were really serious about reliability a "Flash" memory board would
be an improvement. It's been up 3.5 years now.

> I'd only recommend this for a "toy" repeater set up in your spare

RFI is a real problem. Expect to build your own enclosure with good RF
practices. We use a linear (big and heavy) power supply which makes
things quieter and a little more robust.

> I'd sooner roll my own controller from a Z80 or 8088 and a few parts
> than try to adapt a PC to this application.

PC hardware is very inexpensize. The "bang-for-the-buck" is hard to
beat.
Development tools are also very good and readily available.
Wire-wrapping
PCAT I/O boards is possible even for a hobbyist.

> Many people think PCs are suitable for real-time process control...they
> are mistaken. There are very good reasons why a PC is $500 and a real
> controller is much more; and building your own repeater controller out
> of a PC is a very good way to find out why.

I doubt that I'd take off-the-shelf PC stuff up to the mountain top and
stick it in a shed that is not climate controlled. The parts are only
rated from 0 - 70 centigrade. There are uses for ruggedized
controllers.
Even then, I'd consider a PC104 implementation of the PC architecture.

But, I don't understand your comments wrt real time performance. A PC
with
an 80386 is not acceptable for real time control, but an 8088 controller
of
your own design would be ok?

> If you are still sure you want to try this, there's a block diagram of
> the functions a repeater must have in the ARRL handbook (recent
> editions); its all pretty straightforward to implement in software,
> though you'll have a devil of a time making it bulletproof.

BTW, I find DOS and it's lack of re-entrancy to be the biggest headache.
Also DOS has a nasty habbit of disabling interrupts for "long" periods
of
time. For that reason I use DOS with lots of care and only where
necessary.
Linux or any other real operating system would be a big improvement.

In summary, PC hardware (and software) has it's advantages and
disadvantages.
As long as you understand the situation, and deal with it; you're
probably
going to be OK.

We agree on the last point... making it bulletproof has been difficult.
It is possible - and you will learn from doing it. Good thing this is
just
a hobby, eh?

Hello! I've got some awesome news that I think you need to take two minutes to read if you have ever thought "How could I make some serious cash in a hurry???" , or been in serious debt, ready to do almost anything to get the money needed to pay off those bill collectors. So grab a snack, a warm cup of coffee, or a glass of your favorite beverage, get comfortable and listen to this interesting, exciting find!
Let me start by saying that I FINALLY FOUND IT! That's right!. I found it! And I HATE GET RICH QUICK SCHEMES!! I hate those schemes like multi-level marketing, mail-order schemes, envelope stuffing scams, 900 number scams... the list goes on forever. I have tried every darn get rich quick scheme out there over the past 12 years. I somehow got on mailing lists for people looking to make money (more like 'desperate stupid people who will try anything for money!'). Well, when I was a teenager, these claims to 'get me rich quick' sounded irresistible! I would shell out $14.95 here, $29.95 there, $24.95 here, and another $49.95 there. I had maxed out my new Circuit City Card AND my Visa...I was desperate for money!! So, I gave them all a chance but failed at every one of them! Maybe they worked for some people, but not for me. Eventually, I just tossed that JUNK MAIL in the trash when I got the mail. I recognized it right away. I can smell a money scam from a mile away these days, SO I THOUGHT....
I thought I could sniff out a scam easily. WAS I WRONG!! ....I LOVE THE INTERNET!!!

I was scanning thru a NEWSGROUP and saw an article stating to GET CASH FAST!! I thought..."Here on the Internet?? Well, I'll just have to see what schemes could possibly be on the internet." The article described a way to MAIL A ONE DOLLAR BILL TO ONLY FIVE PEOPLE AND MAKE $50, 0000 IN CASH WITHIN 4 WEEKS! Well, the more I thought about it, the more I became very curious. Why? Because of the way it worked AND BECAUSE IT WOULD ONLY COST ME FIVE DOLLARS (AND FIVE STAMPS), THAT'S ALL I EVER PAY....EVER!!

Ok, so the $50,000 in cash was maybe an tough amount to reach, but it was possible. I knew that I could at least get a return of $1,000 or so. So I did it!! As per the instructions in the article, I mailed out ('snail mail'for you e-mail fanatics) a single dollar bill to each of the five people on the list that was contained in the article. I included a small note, with the dollar, that stated "Please Add Me To Your List." I then removed the first position name of the five names listed and moved everyone up one position, and I put my name in position five of the list. This is how the money starts rolling in!

I then took this revised article now with my name on the list and REPOSTED IT ON AS MANY NEWSGROUPS AND LOCAL BULLETIN BOARD MESSAGE AREAS THAT I KNEW. I then waited to watch the money come in...prepared to maybe receive about $1000 to $1500 in cash or so.... But what a welcome surprise when those envelopes kept coming in!!! I knew what they were as soon as I saw the return addresses from people all over the world-Most from the U.S., but some from Canada, even some from Australia! I tell you, THAT WAS EXCITING!! So how much did I get in total return? $1000? $5000? Not even!!! I received a total of $23,343!!! I couldn't believe it!!

I now have a brand new black Acura Integra to speak for, due to this!! Now after almost 8 months, I am ready to do it again!!! So maybe it was possible to get $50,000 in cash, I don't know, but IT COMPLETELY DEPENDS ON YOU, THE INDIVIDUAL! You must follow through and repost this article everywhere you can think of! The more postings you achieve will determine how much cash will arrive in your very own mailbox!! It's just too easy to pass up!!!

Let's review the reasons why you should do this: The only cost factors are for the five stamps, the 5 envelopes and the 5 one dollar bills that you send out to the listed names by snail mail (US Postal Service Mail). Then just simply repost the article (WITH YOUR NAME ADDED) to all the newsgroups and local BBS's you can. Then sit back and, (ironically), enjoy walking (you can run if you like! :o) down your driveway to your mailbox and scoop up your rewards!! We all have five dollars to put into such an easy effortless investment with SPECTACULAR REALISTIC RETURNS OF $15,000 to $25,000 in about 3-5 weeks! So HOLD OFF ON THOSE LOTTERY NUMBERS FOR TODAY,EAT AT HOME TONIGHT INSTEAD OF TAKEOUT FROM McDONALDS AND INVEST FIVE DOLLARS IN THIS AMAZING MONEY MAKING SYSTEM NOW!!! YOU CAN'T LOSE!!

So how do you do it exactly, you ask? I have carefully provided the mostdetailed, yet straightforward instructions on how to easily get this underway and get your cash on its way. SO, ARE YOU READY TO MAKE SOME CASH!!!?? HERE WE GO!!!

*** THE LIST OF NAMES IS AT THE END OF THIS ARTICLE. ***

OK, Read this carefully. Get a printout of this information, if you like, so you can easily refer to it as often as needed.

INSTRUCTIONS:

1. Take a sheet of paper and write on it the following:
"Please add my name to your list". This creates a service out of this money making system and thus making it completely legal. You are not just randomly sending a dollar to someone, you are paying one dollar for a legitimate service. Make sure you include your name and address. I assure you that, again, this is completely legal! For a neat little twist, also write what slot their name was in: "You were in slot 3", Just to add a little fun! This is all about having fun

and making money at the same time!

2. Now fold this sheet of paper around a dollar bill ,(no checks or money orders), and put them into an envelope and send it on its way to the five people listed. The folding of the paper around the bill will insure its arrival to its recipient. THIS STEP IS IMPORTANT!!

3. Now listen carefully, here's where you get YOUR MONEY COMING TO YOUR MAILBOX. Look at the list of five people; remove the first name from position one and move everyone on the list up slot one on the list. Position 2 name will now move to the position 1 slot , position 3 will now become position 2, 4 will be be 3, 5 wil be 4. Now put your name, address, zipcode AND COUNTRY in position 5, the bottom position on the list.

4. Now upload this updated file to as many newsgroups and local bulletin boards' message areas & file section as possible. (Preferrably
about 200, if you have the time) The more you post it the more chances you have of someone responding to it. Give a
catchy description of the file so it gets noticed!! Such as:
"NEED FAST CASH?, HERE IT IS!" or "NEED CASH TO PAY OFF
YOUR DEBTS??", etc. And the more uploads, the more money you will make, and of course, the more money the others on the list will make too. LET'S ALL TAKE CARE OF EACH OTHER BY BEING HONEST AND BY PUTTING FORTH 120 PERCENT INTO THIS PROFITABLE & AMAZING SYSTEM!!! You'll reap the benefits, believe me!!! Set a goal for the number of total uploads you'll post, such as 15-20 postings or more! Always have a goal in mind!!! If you can UUE encode the file when uploading, that will make it easier for the people to receive it and have it downloaded to their hard drive. That way they get a copy of the article right on their computer without hassles of viewing and then saving the article from the File menu. Don't alter the file type, leave it as an MS-DOS Text file. The best test is to be able to view this file using Microsoft's Notepad for Windows 3.x or WordPad for Windows '95. If the margins look right without making the screen slide left or right when at the ends of the sentences, you're in business!

5. If you need help uploading, simply ask the sysop of the BBS, or "POST" a message on a newsgroup asking how to post a file, tell them who your Internet provider is and PEOPLE WILL ALWAYS BE GLAD TO HELP. I would try to describe how to do it but there are simply too many internet software packages with slightly different yet relatively simple ways to post or upload a file. Just ask for help or look in the help section for 'posting'. I do know that for GNN, you simply select 'POST' then enter a catchy description under the subject box, choose 'ATTACH', selecting 'UUE' and NOT 'TXT', then choose 'Browse' to go look for the file. Find your text file CASH.TXT and click on it and choose 'OK'. Place a one line statement in the main body section of the message post screen. Something like "Download this to read how to get cash arriving in your mailbox with no paybacks!" or whatever.

Just make sure it represents its true feasibility, NOT something like..."Get one million dollars flooding in your mailbox in two days!"

You'll never get ANY responses!

6. And this is the step I like. JUST SIT BACK AND ENJOY LIFE BECAUSE CASH IS ON ITS THE WAY!! Expect to see a little money start to trickle in around 2 weeks, but AT ABOUT WEEKS 3 & 4, THE MONEY STORM WILL HIT YOUR MAILBOX!! All you have to do is take it out of the mailbox and try not to scream too loud (outside anyway) when you realize YOU HIT THE BIG TIME AT LAST!!

7. So go PAY OFF YOUR BILLS AND DEBTS and then get that something special you always wanted or buy that special person in your life (or the one you want in your life) a gift they'll never forget. ENJOY LIFE!

8. Now when you get low on this money supply, simply re-activate this file again; Reposting it in the old places where you originally posted and possibly some new places you now know of. Don't ever lose this file, always keep a copy at your reach for when you ever need cash. THIS IS AN INCREDIBLE TOOL THAT YOU CAN ALWAYS RE-USE TIME AND TIME AGAIN WHEN CASH IS NEEDED!

9. (This step added by Charles Reiley). Hello, This is exciting, isn't it?! While I'm on the list, just add a note saying "Please include extra money tips" with your name & E-MAIL address, and I will (FOR FREE) send you some neat methods to increase the money you will receive with this plan. Why?... Why not? I'm not a selfish jerk...I like helping out others. E-mail just makes it a touch easier and cheaper, too! After I drop off the list, I can no longer offer you this advice, obviously, but maybe someone else who gets my tips will offer and simply replace my name on this step number 9. Good luck and give this plan your all, it will definitely pay off! Like Mike said, HAVE FUN WITH IT!!!

>In article <DwwC4I.Bxu@pe1chl.ampr.org> rob@pe1chl.ampr.org (Rob Janssen) writes:

>Hello Rob.

>>"I have not tested it but it runs flawlessly". This is the comment that
>>you see from many commercial-FM-transceiver 9k6 users. Often referring
>>to a claim from others that it is inadequate.

>>However, please not that the vast majority of people who DID test it, will
>>tell you it IS inadequate.

>"Inadequate" in what way?

1. the quality of the transmitted signal is poor. just look at the eye
pattern when receiving it on another receiver.
this means you have inherent "noise" in your transmissions that causes
bit errors at the other end. you will need a stronger signal than would
be necessary with a good quality transmitter.

2. the required TXDELAY is long. in 250ms you could have transmitted 300
bytes of information, but your station is just idling through all that
time. what a waste.

>>>The only downside is I have to run a 250ms TXDELAY thru the repeater, as the
>>>PLL (of course) "sweeps" a little when switching from the TX freq, to the RX
>>>freq...and vice versa.

>>That downside would be sufficient for me not to buy it. And it should
>>be for you as well.

>Well...I certainly wouldnt pass judgement on others what to buy, but lets not
>forget...everyone has to start somewhere.

But is is a *VERY BAD* idea for everyone to start with inadequate equipment
and then later having to upgrade it to decent stuff.
Remember that most people buy these radios because they are '9600 baud
ready', which the really aren't. The money is better spent on a suitable
radio in the first time.

>>You are causing QRM on nearby channels with that sweeping transmitter
>>(which is a design problem that plagues ALL Kenwood TM-[2345][34]1
>>transceivers), and the long TXDELAY cuts into the efficiency of the
>>channel.

>With the deviation set correctly (3.0), it does not sweep outside the 5khz
>limit, but I agree that "long" TXDs affect channel effeciency.

On the 1200 MHz model, it sweeps about 2 MHz outside of the channel.
I don't know the exact figure for the 430 MHz model, but I think it
is a few hundred KHz. Put your station in some fast beacon mode (where
it transmits a packet every few seconds) and go to a nearby amateur
and tune over the band near your transmit frequency. You will be
disgusted.

>>You share the channel with everyone else, so you should be considerate.

>I run the same TXD as most users on the freq.

That is required with that transceiver because of its terrible performance.
Had you chosen a Tekk, you could be running a 10 or 20ms TXDELAY.

>>>Other than that...I like it very much, and it works well.

>>You have not tested it. How would you know?

>It works well in the regard of solid connects, and no retries with other
>stations, and when on the 9.6k repeater, results are the same.

Please send a 200K file to one of your fellow amateurs, and report us
the total number of retries during that file transfer and the effective
bitrate you have achieved for transferring the entire file.
We don't mind if you take a few weeks before you publish the results
because I'm sure you will be disgusted when you look at the first test
results and you'll want to tweak everything you can to publish something
that won't make you blush.

Good luck!

Rob

This lame design seems to be Kenwood's favourite.
The TM-[2345][34]1 series suffer from it as well.

Because of an unfortunate decision a long time ago, many nodes in
the Netherlands use Kenwood TM-531E transceivers for (at least part of-)
their 1200 MHz links to neighboring nodes.

When you are living near such a node, a 2-3 MHz band segment around the
transmit frequencies of the node is filled with 'static' caused by the
several transmitters keying up and sweeping to their operating frequency.
Of course, the links are busy and each transmitter keys at intervals
at most 10 seconds apart.

Even worse: when a node has more than one link roughly in the same
direction, e.g. a link to a neighboring node and a link to a nearby BBS,
the transmissions on one of the links cause data corruption at the
remote receiver on the other link.

This is not theory, it has been directly proven in practice.
(switch off one of the link, and the quality of the other link improves!)

Using the 70cm version of these transceivers (for user access) has
exactly the same problem because different frequencies are in use for
each neighboring node, and the sweeping over the band during keyup
will cause QRM in the neighboring node's area.

4653. Radio link in the 70 cm band

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-08-30 00:00:00 UTC
From: qpkmima@epk.ericsson.se
Message-ID: <506ne8$oc3@erinews.ericsson.se>
Source record: 34943

Hello,

my name is Michael Martinsson. I'm studying at a University in Sweden. I need some help constructing a radiolink. The problem we deal with is how to get information from a mobile plattfrom in the see to the University. The distance should range from about 100-500 m. The link should be line of sight. The amount of data to be tranfered is fairly low, probably just data collected from different sensors. It may though be interesting to transfer pictures taken from a digital camera. The data will be collected from the sensors and saved in a RAM.

We have been asked to investigate a couple of possible solutions and give a couple of proposals. Preferable some professional solution and some cheaper solution that the students can build by themselves.

We have been discussing several solutions:

Professional solutions:

* Radio modem

* Tranceivers for amateur radio with possilities for data communication.

* Using the features from GSM. If it's possible to have a GSM telepohone with a PCMCIA to answer when dialled up and tranfer data.

Other sollutions:

* A transceiver and controller circuit that is easy to connect to a microprocessor like PIC or HC11. We have a complete solution that we are very hopefull about. This solution seems very intersting and cheap.

I would like some comments about my suggestions and if you can give me some other. If you have any advice about the construction or can give me any name of the products and their price I would be very happy. In the first step our job is to do an investigation whereby any information is useful.

I think the band 433,92 MHz is the best for this problem, but if you have any other comments, please let me know.

Best Regards

Michael Martinsson

4654. DSP-232 / TH-79AD Packet problems

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-08-30 00:00:00 UTC
From: flywheel@taunet.net.au
Message-ID: <506r56$sqj@pellew.ntu.edu.au>
Source record: 34944
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment

Hi,

I recently bought an AEA DSP-232 TNC/Data controller,
and I'm trying to operate it in 1200 baud packet mode
with a Kenwood TH-79AD HT. I am able to connect with
a local BBS, but there seem to be problems whenever I
the BBS forwards large chunks of data (i.e. several
packets in a row). Everything will be proceeding smoothly,
and then the DSP-232 decides to transmit while the BBS
is still sending data. Then everything stops until the
BBS times out and retries and the DSP-232 acknowledges.

Now here's an interesting symptom: When I unsquelch
the TH-79, the tuning indicator LEDs on the DSP-232
are skewed towards the "Mark" side. Similarly, when
packets are being received, the lights are skewed
towards "Mark". I attributed this to poor frequency
response from the TH-79.

So then I tried a couple of experiments: I connected
the TH-79 to a friend's MFJ TNC. His tuning indicator
seemed to behave as expected (i.e. properly centered),
and the data seemed to flow smoothly. Next, I tried
connecting my friend's 2 meter radio to the DSP-232.
This time, the DSP-232 behaved as expected (properly
centerd tuning). So it seems as though the DSP-232
doesn't "like" the TH-79. I'm at a loss to explain it!

I've tried varying the RF tuning by +/- 5 KHz. This
did not cause any change (nor was this expected, because
it's FM). I've tried tweaking several of the packet
parameters in the DSP-232, including PPERSIST, PERSIST,
MAXFRAME, etc. I've connected various combinations of
resistors and capacitors between the TH-79 output and
DSP-232 input. I've also played with the "WHYNOT" command,
in an attempt to figure out why some of the packets are
failing....

I would appreciate any advice, help, condolences, or
whatever!

Thanks,
Gary VK8GT / KE3WK

4659. Packet wormhole network using phone/fiber link?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-08-30 00:00:00 UTC
From: raf@dwroll.att.com
Message-ID: <DwyqzC.2Kq@bigtop.dr.att.com>
Source record: 34949

We have access to a voice channel on a T1 link over fiber, and we are looking to use it for a wormhole. That is, put a transceiver at each end, and link them over a standard voice channel, over fiber. The two transcievers would be separated by 100 miles or so.

I have looked around on the TAPR page, and have not seen anything addressing this somewhat unusual plan. Surely other people have done this.

So far, we have thought of three ways to do this:

1. One dual-port TNC at one end, remote the transciever at the other end. This would probably require designing our own signalling system, probably using a 2800 khz tone to key the remote transceiver. Anything available to buy to do this? subaudible tones are too slow.

2. Two dual port TNCs, one at each end, use one of the TNC ports connected to the phone line. In other words, we would be using the fiber voice channel as if it was a radio link. This would add an extra link/hop, and perhaps slow down packet delivery. A little extra cost for two dualport TNCs, but not that big a deal. Any other downsides? We should not have to invent anything.

3. One TNC at each end, use a phone modem to link the two TNCs back to back. However, what kind of a phone modem to use? We don't want one to dial or answer, we would want them up automatically any time they could hear each other. Any ideas on where to buy such a modem? Is it easy to hook up two KPC3's back to back as a network, even if they are in the same room?

Any thoughts or suggestions would be appreciated, including pointers to suitable web pages. We have been using packet for years, but have limited experience with networks.

From: interflex@msn.com
Message-ID: <00001fec+000017cd@msn.com>
Source record: 34806

Barry,

KaGOLD has support for Callsign datasets (SAM, QRZ, Buckmaster, Radio Amateur Callbook, SAM), Conference mode (remote started conferences), Remote commands (e.g. //join //who etc.), it is a DOS app with Windows awareness, so runs in all platforms, including OS/2, NT, 95, 3.11, etc.

KaGOLD runs the KAM in dual port mode, you can do VHF packet while doing HF AMTOR, RTTY, Pactor, Gtor.

Windows 95 can be set to "automatically" use different fonts for DOS apps (not for Winapps) which means you can resize KaGOLD in Windows 95, and still see the entire screen, but in a portion of the screen. If you try to run a Winapp in part of a screen, you get scrollbars, and can only see the parts of the Winapp that are revealed by the reduced window size chosen. Many users have found that this makes operating KaGOLD in Windows, along with other applications, VERY convenient, since you can make the KaGOLD screen very small, still see what is going on, and see all of the activity.

Check out the Web page: http://interflex.com or send a request for info to: info@interflex.com

>these PRO's to help us out. I guess I better not tell them I am using a ten
>year old radio on 9600 baud packet, I might get reamed too.

Well, Jim, I guess you don't read my posts for the same reason you
don't read Gary Coffman's posts - you might accidently learn something.
However, this doesn't stop you from Drewing, oops, I mean spewing out
comments anyway ;-).

If you'd read my posts, you would have noted that I was explaining
that Greenhalgh's _modern PLL radio_ is not suitable for 9600
baud. Furthermore, if you'd thought about what I wrote, you'd
discover that many older crystal-controlled radios are suitable
for 9600 baud packet. In fact, some of the best and most popular
radios at 9600 baud are Motorola Mitreks, most of which are older
than ten years. Also excellent are Maxars, Maxar 80s and Flexars
(the Flexar I'm currently using for 9600 baud here is from 1980!).

What you apparently did was skip over all the technical content and
home in on Greenhalgh's strawman "not everyone can have the best
radios money can buy" whining. I never said he needed the best
radio money can buy - I simply pointed out that his PLL radio
in unsuitable for a number of technical reasons.

>that KAGold is good, but there is also Hostmaster II+. What is
>the best to get ???

The KAGold is a super program, it has to be good for the price they ask for it! Before I bit the bullet and got it, I ran PaKet6. It is an excellent shareware program, has a built in mailbox, supports script files, etc. You can get it from several places on the internet.

For a long time I wondered from one TNC program to another. I tried every one I could get my hands on. When my friends started raving about KAGold I held off because of the money, but when I tried it I was hooked! Of course, this is including a lot of HF work including Pactor which is a blast.

Hope this helps at least a little!

Have you tried Tucker Electronics ??? They have a Web page.

Also, pick up a copy of "Popular Communications" magazine. Many smaller companies advertise in the back and they have better prices.

License needed, but a suitable application for amateur radio. There
are companies that produce data only transceivers for 70cm.

> * Using the features from GSM. If it's possible to have a GSM telepohone

You would be using Low Power Devices which can suffer from interference
from othe LPDs and amateur radio stations.

Personally, I would try the amateur radio approach and publish the
results in an amateur radio magazine.

Hope that helps,
Jens, DB9LL

Hi,
The right manner is to put on autoexec.w40 is the autoexec of win95
and too add the line you like for BPQ
like as :
cd \bpq
bpqcode
cd \
and copy the files BPQCODE.386 and BPQDLL.DLL into WINDOWS\SYSTEM directory
that's all
!! NOTE: is important you get the vesion 4.08 or 4.08a from G8BPQ
I use some combination under win95
i running Jnos and WinFBB + BPQ under win95
bye i hope this is a help for you

How damned good is GOOD???
I sailed a 42' sailboat from California to the Panama Canal to the
Yucatan to Florida ... GPS was my primary electronic nav system and it
was great. Sailing along the coast (usually 5-40 miles off shore ...
sometimes much more) we'd plot position on the chart every 15 min from
the GPS fix. Going north from the canal -> the Yucatan, one goes
through some areas with som REALLY hairy shoals and reef areas ... even
200 miles offshore. GPS led us through just fine.

Actually, a good CA code receiver can do about 10m CEP (circular error
probability) with SA turned off with SA turned on DOD screws that up to
100m CEP ... that's good enough for MOST navigation, for sure.

Well since I started with TCP/IP I wouldn't ever think of putting
AX25 back on again. I think this is much more fun then any other
packet mode I have ever run. I was almost the same here, I didn't
think it was any better then AX25 till a friend got me to at least
try tcp/ip now this is all I have on the computer. NO MORE AX25.

Well - - -

KaGold is OK, but it is AWFULLY expensive. And it requires that you contact the manufacturer before you can use it. Which means if you get it on a holiday or on a weekend, be prepared to stare at the diskette until they open. And it's a long distance call.

I was absoultely amazed to learn that, until not too long ago, the software does not take advantage of extended/expanded memory. They wanted a rather stiff price for "upgrading" to the version which does take advantage of the extra memory. This memory "feature" should have been in the program LONG ago.

What they really need is competition.

73 & good luck.

Pheezer

4683. BPQ Ethernet Parameters Please

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-09-01 00:00:00 UTC
From: flees@fastnet.co.uk
Message-ID: <32296216.0@news.fast.net.uk>
Source record: 34829

Hi,
Thanks for having a look at this one, I'm puzzled as I am trying
to get something simple to work. I want to get BPQ to talk via
Ethernet to anther BPQ so that I can demonstrate a YAPP download
at a talk I am giving tomorrow (Monday 2nd September). I have
configured a BPQ NET.CFG file with the following in it: -

```
LINK DRIVER NE2000
FRAME ETHERNET_II
INT 9
PORT 300
PROTOCOL IPX 0 ETHERNET_802.3
PROTOCOL BPQ 8FF ETHERNET_II
```

If I read things right I load LSL.COM then ODIDRV.EXE 9 and it
should all work, of course then I have to load the BPQCFG.TXT
and BPQCODE. At this point I get a ring round as when I enter
anything I get 6 echos of the same key stroke!

Wonder if you are able to help with a CONFIGURATION that works
for you and maybe I can then edit it to work for me.

Many thanks in advance.

Cheers de Fraser.

I'd suggest ignorance is recomending using an unsuitable $500 radio
to do the job of a $100 data radio. It's cheaper to do it right than
it is to do it wrong, and you'll cause less harm to other users of
the LAN in the process.

>is setting in the box not getting used.
>
>--Jeff Scoville KC5RTH

High deviation is a definite no-no for packet. A maximum deviation
of 3 kHz should be observed by all users. The reason is very simple.
High deviation can cause the signal to go outside the IF filter
passband or outside the linear response range of the demodulator.
While this sort of distortion is tolerable for voice peaks, it is
not tolerable for data. The eye will collapse, and a high bit error
rate will result.

Make sure you aren't delivering too high an audio level to the
Baycom unit. This will also cause distortion and raise the BER
by exceeding the slew limits of the unit. Also make sure the
capacitive coupling of audio to the Baycom unit is of sufficiently
low reactance, IE 0.1 uF or larger. Otherwise you'll get tone twist,
and that'll raise the BER too.

Remember, less is more when it comes to audio levels, both in
and out. Use the lowest audio setting which works for receive,
and the lowest setting that works for transmit if you don't have

a way to measure deviation accurately. The most frequent problem
users have with 1200 baud packet is excessively high audio levels.

I use KaWin, which is a windows based host mode software package for the KAM. I tried KaGold, and it was ok, but it is not a windows based app, and since I run Windows NT on my Digital Alpha processor, I'd rather use the Windows program vs. the DOS based program.

Source record: 34837

Hopefully people reading messages on the newsgroups will read more than one account or review of any product. KaGOLD is a commercial product, with a lot of features.

One user recently posted the following comments:

"KaGold is OK, but it is AWFULLY expensive."

KaGOLD lists for $99.95 but there are occasional promotions with discounts. At the list price, it is abut $20 more than some of the other commercial programs, such as HostMaster, which sells for $79.95. A side by side comparison of the features of KaGOLD and HostMaster, for example, would indicate that for the added $20, the user gets ansi graphics, conference mode, support for several CD callsign databases (QRZ, AMSOFT, Buckmaster, The 1996 Radio Amateur Callbook, SAM), remote commands (users who can write batch files, or even write C-programs can access them via the remote // commands), stable operation in DOS, Windows, 3.xx, 95, NT, OS/2, huge scrollback buffers, binary file transfers, etc.

"... it requires that you contact the manufacturer before you can use it."

Not for the vast majority of users purchase the program directly from InterFlex. For those who buy from a retail store, the packaging indicates that the program needs to be registered with InterFlex either by Fax, Phone, or e-mail. Many do it by BBS, e-mail, fax, or phone. Long distance rates being about 25 cents/min, it might be another $1.00 total to register, get on the user list and mailing list.

"I was absoultely amazed to learn that, until not too long ago, the software does not take advantage of extended/expanded memory."

KaGOLD and PkGOLD automatically use XMS or EMS memory, and have been doing so for years. What is new with "GOLD/386" is the user of Protected Mode (using a DPMI driver) that is supplied. It can also use the XMS memory provided by Windows or OS/2. The main advantage of DPMI operation is that the scrollback buffers increase in size to about 50 times the original 200-K. Also, memory is managed dynamically, so the user never "runs out of memory" or finds the program crashing due to buffers filling up as is the case in some

other programs.

Users with questions about KaGOLD can visit the web page at
http://interflex.com or send for additional information to:
info@interflex.com or ask a question by sending it to
support@interflex.

Thanks

Jeff, WA4EGT

Hi... I'm trying to wire up a TNC-radio connecter to my PacComm Micropower 2 TNC. for those of you that don't know, it's the 9600 baud version of the TINY-2.

I have a couple questions...

1: does pin 2(ground) hook up to the Tx or Rx plug for an Icom 02AT?

2: do I need to put any resistors or capacitors in line with the mic. plug?

3: would the mic/speaker plugs need to be stereo or mono plugs?

4693. Re: Why not a BayPac BP-2M, Why a KPC-3

>with my hobby(amateur radio).

The BayPac unit is just a modem, the KPC-3 is both PAD and modem.
By offloading the packet assembly disassembly chore from the computer,
you free the computer to do other things. The KPC-3 has its own embedded
microprocessor to handle HDLC, AX25, channel management, etc. It even has
a mailbox which holds messages in its internal RAM if your computer is
offline. BayPac has none of this. It's just a dumb modem, and software
running on your computer has to bang out packet bit by bit to and from it.
Remember that packet uses synchronous HDLC frames, so you can't use the
serial port conventionally to handle this. You have to bit bang. That
requires precise timing. If you're running Windoze, you may have
problems using BayPac. The KPC-3 can talk to your computer using
standard async ASCII via conventional serial port usage, with flow
control, so timing isn't critical.

The BayPac unit steals power from the computer port. If you use a
laptop, there may not be sufficient current available at the port
to operate the BayPac unit. (Some laptops do, some don't.)

OTOH, the KPC-3 only does packet, and only at 1200 baud. If you
have aspirations of doing other things, IE 9600 baud, or WEFAX,
then some other TNC will be a better choice. (Realize you'll
probably need a different radio too, a HT is unsuitable for
9600 baud or WEFAX.)

>use some use some character stuffing to escape the characters for which
>the system isn't transparent.

Sure you can. Transport and application needn't use the same formats.
Transport should use compression and the full octet capability of the
medium to avoid waste. How the data is structured or represented internally
by the application is a separate issue.

>>We could use the Xmodem protocol over plain AX25 if we wished, and pick

>a checksum/CRC on these protcols, which makes the resulting end-to-end link
>(host to host) unreliable.
>An extra checksum at some of the higher levels does not hurt at all.

That's just another reason not to use TNCs. That's an obsolete paradigm
anyway. A PI-2 card in the computer eliminates the troublesome serial
link.

>>We could just use a stream protocol with a header only added on a file
>>by file basis if we wished, and that would be even better than using
>>Xmodem or G protocol with their redundant packetizing of the data
>>stream. (This is the virtual circuit model, of course.)
>
>This basically is what YAPP does. What is your problem?

I don't have a problem, but Yet Another Packet Protocol
doesn't offer integral compression, and a good transport
protocol should.

>modem shouldn't cost what it does either).

The price is in the same ballpark as AEA's high end TNCs, but they
can't do 56 kb. The transverter costs no more than the voice grade
radio you'd buy to work with the AEA. Without getting too specific,
the margin is darn thin on these units because volume is low and
we don't get to take advantage of economies of scale. If you guys
will commit to buying several thousand units, money up front, we
might be able to lower the price substantially.

>I don't believe the new version has I/Q outputs. I'd have to call up
>WA4DSY's home page to look since PacComm only give you a stapled 3-4 page
>"how to hook it up" photocopy with no technical data.

The original modem didn't have I/Q outputs externally either. Just
as with the old modem, you can bring them out, but there's no header
internally so it requires a bit more cut and paste than with the
old design which used 3 separate PC boards. Everything in the new
modem is all on one board.

>wb9mjn@wb9mjn.ampr.ORG wrote in article <10948@wb9mjn.ampr.org>...
>>
>> Hi Ron,
>>
>> I don t think the GRAPES modem is dead, but I ve also made comments that
>> there is an extra 300 dollars fat in the line up to make a 56 KB DSY
>signal
>> at 10 to 20 watts.

Well, a transverter is a lot simpler than a complete radio, but I can't
market one for much less than $300 in the volumes expected. So give us
a complete 20 watt RF solution that costs $300 less to produce and market
in small quantities, IE make it *free*. We don't have the economies of
scale of a mass market item, we don't have $100,000 in ATE to make it
meet FCC spectral purity limits on the production line, and we can't
afford to stock more than one model. Which band should it be?

>> I think allot of it is due to the transverter. But, for the money, the
>> demod should have a coherent/non-coherent mode.

A coherent demodulator has a longer lock up time (Dale tried it). If Dale had done that we'd have too much TR delay for efficient 56 kb half-duplex operation. This isn't intended to be a weak signal modem, so there is no good reason to trade speed for better performance at the noise floor. Give it a microvolt to work with and the BER is 1 in 10^6, what more do you need?

>> The higher u go, the more expensive the trasverter approach gets. A
>better
>> way to go is with a I/Q radio, at 440 and higher. And these days, there
>are
>> even chips to do most of the I/Q radio.

Building the complete radio into the modem limits its flexibility. If we'd chosen to output on 70 cm instead of 10m, you'd be unable to use it on the 219 MHz allocation. A RF modem capable of driving a transverter is what the ARRL Digital Committee wanted, and that's what they got. The cost of stocking several modems with outputs on different bands makes that option a non-starter for the sales volume expected. You have to supply your own last mixer and PA in the form of a transverter. That's not unreasonable when you realize that for any other packet setup you have to supply a complete external radio.

Price out 6 PCS9600D Azdens and 6 G3RUH modems (and the data pumps to drive them), or price out 48 DR-1200 Alincos and 48 1200 baud TNCs, and then price out one of our modems, a PI card, and a transverter. We're offering 6 times the performance of 9600, and 48 times the performance of 1200 baud, but the cost is 8 times less than the equivalent 9600 baud setups and 27 times less than the equivalent 1200 baud setups. You're getting a heck of a deal for the money if you've got data to move. If you can't fill a 9600 baud pipe, then you'll come out cheaper going that route. 1200 baud is such a bad deal, no one should be going that way anymore.

(Yeah, you can go cheaper with surplus radios, but I can go cheaper with used transverters and hacked NCR cards too. And I don't need a relay rack full of radios, Hoover Dam to power them, and 48 antennas and feedlines to do it.)

>whatever!

Well, it's a Kenwood, what'd you expect. :-)

I think you're on the right track thinking you have an
audio equalization problem. You say it works Ok with
the MFJ and I know that unit has a 10 kohm input impedance.
What's the input impedance of the AEA? It should be high
enough to "bridge" on the output of the Kenmore. You could
try using a 45 ohm "dummy" load on the Kelvinator and
bridge across that with the TNC. The lack of proper load
may be messing up the output amp response in the Kenworth.

Perhaps there's a wee bit of DC on the Kemtone's audio
output. That could be biasing the AEA out of spec if its
input isn't capacitively coupled. The MFJ uses capacitor
coupling for its input audio. Try putting a 0.1 uF in
series with the audio line.

One final thing to check. Look at your common connection
to the radio. You should use either speaker low or mic
low, not both. One may not *really* be common, so try
each one in turn.

>just data collected from different sensors. It may though be interesting to
>transfer pictures taken from a digital camera. The data will be collected
>from the sensors and saved in a RAM.

Well, depending on peak data rate needed, this is a pretty simple
application. If we assume 9600 baud is sufficient, then all you
need is a pair of Tekk KS900 data radios (under $150 each crystalled
to your 70 cm frequency), and a pair of G3RUH style modems (about
$100 each). This will give you a data link. (At this range you
could use straight FSK of the radios and dispense with the modems.)
Without further control, however, it would be a one-way link.

If you want the data integrity and link control offered by packet,
you can nestle those modems in TNCs. PacComm Tiny 2 would be fine
(about $140 each). Or you could go with the Kantronics 9612 which
is a TNC already fitted with a 9600 baud modem (about $225).
Using packet gives you a two-way link so you can issue commands
as well as receive telemetry.

TAPR offers a product called Metcom which is hooked to sensors
and the serial port of a TNC and interrogated via packet for
remote telemetry. It probably won't handle video data though.

Another approach would be to use spread spectrum wireless modems
like the NCR Wavelan cards. This will pump a respectable amount
of data (about 250 kbps). Cost per pair is a bit over $1,000,
and you'll need PCs to host them at each end. A data aquisition
card in the PC can handle your sensors. This would also be
two-way.

Or you might want to try a non-radio approach since you have
true line of sight. Use an IR wireless LAN link, tracking the
platform with a crude telescope on the shore. This could be
quite cheap, just a jumbo LED for the transmitter and a
photodiode for the receiver. Data rates in the 40 kbps range
should be possible with suitable interface circuitry. The
big advantage of this setup is that no licensing would be
required. This would have to be a one-way link, though, because

you couldn't get a telescope on the platform to track the
shore unit without more servo-mechanisms than you probably
want to deal with.

You didn't mention power budget, but this could be a concern
for the platform too. If your power budget is tight, you may
need to simplify your requirements. The KS900 draws about
6 watts (2 watts output). You might want to use a Micropower
TNC (PacComm), and a custom controller based in CMOS to manage
telemetry.

At the range you need, the Motorola MC2800 one chip FM
transmitter may be sufficient (10 mW output). There is
a companion one chip receiver. These chips are commonly
used in cordless phones. A quick trip to the discount
store might get you everything you need.

In fact this is probably the best solution. Just get a
cordless phone, maybe boost its range a bit by improving
its antennas, and use ordinary telephone modems over the
link.

>
>Carl - wa6vse
>carl@ais.net

Ok, zero-zero visibility, low fuel, the runway down there somewhere
is 36 feet wide, and the odds are SA is going to put me in the weeds.
Or less life and death, a 100 meter error puts me in the next subdivision
on the City Streets map display. Or back in the fog, I'm going down the
river with a barge train, 80 feet wide with a turning radius of 2 miles.
The river has a 150 foot wide navigable channel, SA puts me aground.
Or back in the air again, clear sunny day, I'm in an Ag plane carrying
a load of weed killer. Lets see, is it that field I'm supposed to spray,
or is it that one over there. One's corn the other tomatoes, but I can't
tell that because I'm spraying pre-emergent herbicide. Choose right, I
get paid, choose wrong, I get sued. Or I'm mapping out a cable system
using GPS, the SA error means I wind up 100 meters short on the cable
run to the next line amp with my 1000 foot spool. Oops! Open ocean isn't
the only place we want precision navigation, and the other places often
require more precision.

Note of course that GPS isn't used for any of those things today,
and that's because SA makes it too inaccurate. DGPS can make it
good enough, but that's a kludge, and it only works some places.

One user writes: "I use KaWin, which is a windows based host mode software package for the KAM. I tried KaGold, and it was ok, but it is not a windows based app, and since I run Windows NT on my Digital Alpha processor, I'd rather use the Windows program vs. the DOS based program."

One of the advantages of KaGOLD in Windows is that when it is resized to say 1/2 or 1/4 of the screen, the entire program is still visible due to the way Windows varies the font used. For Winapps, once they are resized to anything but full screen, the user is faced with scrollbars, and cannot see the entire program display. Well-behaved DOS apps in Windows (any version) or OS/2 run fast, smoothly, in the foreground or background, and when resized, still present a complete display of the program screen.

For those who want to run multiple programs, and SEE all that is going on in the programs they are running will find that Windows does NOT even address the issue of dynamically resizing the "font" bitmaps on Winapps, so KaWIN, for example, when resized, cuts off parts of the screen. Also, because KaGOLD gets control of an entire time slice (not sharing it with other Winapps as is the case with "true" winapps), and because KaGOLD is native code (not interpretative VB code) it runs very fast in Windows, 3.xx, 95, NT, and OS/2.

Yes, Winapps have some nice features, but users should realize that Windows 95, NT, and OS/2 provide solid support for well-behaved DOS apps. Also, some of the major advantages for Winapps (linking to other apps for example, or embedding objects from other apps) are really not of much use for a communications program. Users should experiment with their Winapps and try resizing them to 1/4 of the screen and see the visibility problem for themselves.

You're getting your interrupts mixed up! INT 9 and PORT 300 in NET.CFG must match your settings on your ethernet card - that INT is a hardware interrupt.

The interrupt number on the ODIDRV command line is the software interrupt that ODIDRV should use to talk to the BPQ switch, and must match the INTLEVEL setting of your ethernet PORT in BPQCFG.TXT. Here is the NET.CFG that I use, my port setting from BPQCFG.TXT and the load order of the various programs - note you need to load a driver for the card, which you don't mention.

```
NET.CFG **************************
MAX STACKS 4
MAX BOARDS 4
LINK DRIVER NE2000
INT 11
PORT 320
FRAME ETHERNET_II
Frame Ethernet_802.3
Frame Ethernet_802.2
Frame Ethernet_SNAP
PROTOCOL BPQ 8FF ETHERNET_II
*********************************
```

```
Ethernet PORT from BPQCFG.TXT ****
PORT
ID=Ethernet
TYPE=EXTERNAL
PROTOCOL=KISS
INTLEVEL=125
QUALITY=10
MAXFRAME=4
SLOTTIME=100
PERSIST=128
FULLDUP=1
FRACK=2000
RESPTIME=1000
RETRIES=10
PACLEN=250
UNPROTO=ID
ENDPORT
**********************************

PROGRAM LOAD *********************
lsl
ne2000
odidrv 125
bpqcode
**********************************
```

Finally, when you get it working, if you're using it seriously as opposed to just for a demo, try and force all ethernet connects to level 2 whenever possible - getting rid of the Netrom overhead can double the achievable through-put.

Sorry, I do not know of any code readly avaialable... I
was thinking of writing some to control an ATV repeater. I was going
to use a CGA board so that the composite video can be used for ID, and
an old 8088.

BUt there is a compeating proposal to use a basic stamp
micro controller to do the control. They cost only $39, and draw
next to no power (microamps I think). They are programable in basic,
and have language extentions for real time control. I know of one
repeater that uses this controller, and the code fits in the on
board EEPROM memory!

>>
>> Ouch. Isn't it hard enough to keep a repeater running reliability
>> without burdening it with the additional instability of a typical PC?
>
>Not true. The repeater that I'm affiliated with, is hosted by a PC

Agreed. I know of one ATV repeater that ran for over 2 years
on a Commadore 64 in BASIC! He did have to use a third party power
supply, but other than that, it ran just fine! Of course it was inside
the house, and not on a mountain... I know that PCs are MUCH more
ruggedly built than Commadore 64s!

The point is that PCs are really cheap, and are used for
7days a week / 24 hours per day applications all over the place!
Like for ISP servers, etc.

>> Many people think PCs are suitable for real-time process control...they
>> are mistaken. There are very good reasons why a PC is $500 and a real

>> controller is much more; and building your own repeater controller out
>> of a PC is a very good way to find out why.

Hmm.. I know that a lot of people use imbedded PCs for real time
control. We used some in simulators...

I guess that it depends on how critical the consiquences of
a "failure" is. For medical systems where a failure is deadly, then you
may have a point. But what is the worst case failure of a repeater?
Keydown for several hours until someone notices? That can be fixed
with a hard wired timout. Denial of service? So? As long as it does
not happen very often, so what? You are not loosing money for
"subscribers", etc...

>BTW, I find DOS and it's lack of re-entrancy to be the biggest headache.
>Also DOS has a nasty habbit of disabling interrupts for "long" periods
>of
>time. For that reason I use DOS with lots of care and only where
>necessary.
>Linux or any other real operating system would be a big improvement.

I see using Linux as massive overkill for a simple repeater!
I think that a simple BASIC program that reads and writes to the
parallel printer port (used as I/O port for PTT, Squelch input, etc)
can do most of the basic functions. We are not talking about anything
that needs speedy responce! A single big polling loop software
routine should handle most applications.

Now if you have a dozen remote recieve sites, and multiple
transmitter locations, and digital links to all with diagnostics
and measurments of system performance, and environmental conditions,
via SNMP to a central monitoring station, etc, then
I would agree, linux would be a better choise...

There are several programs avaliable for using a sound card for SSTV
operation. I downloaded one, made an audio cable for the connection
between the rig and SB, tuned to 14.230, and it just worked!

Do a net search (using Alta Vista) on SSTV near SOUND. Follow the
links and find the software that seems right for your application.

I am having a problem with my C508A HT. I am trying to use it for an ultra-small QRP Packet radio rig along with a Baypac modem and a HP200LX palmtop computer. Well, this setup works just fine on my Alinco DJ-580 HT.... but when I hook it up to the Standard C508A (the tiny shirt pocket dualbander) It can send packets, but can't receive packets .... go figure. I have placed calls to TigerTronics ... they are helpful, but can't help me with this HT. I tried hooking this same HT up to my desktop and Kantronics KPC-3 TNC and the same thing happens (sends OK , but can't receive packets) ... the Tigertronics fellow thinks that there might be a problem with audio filtering in the HT.... Can anybody shed some light on this problem? I would be most grateful.

4708. Program Release - XPWare for Windows

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-09-02 00:00:00 UTC
From: gjohnson@indirect.com
Message-ID: <50df9j$1r9@globe.indirect.com>
Source record: 34854

I released the XPWare for Windows (XPWIN) program today and
it is available via FTP or WWW at the address shown in the signature.

This program supports the following hardware.

AEA PK88, PK232, PK900, DSP232, DSP1232 and DSP2232 (Host Mode)
Kantronics KPC-3, KPC-9612, KAM and KAM+ (Host Mode)
SCS/Paccomm PTC, PTC-Plus and PTC-II Controllers
Hal P38, PCI4000M and DSP-4100

Has binary transfer support for Clover, GTOR, Packet (YAPP) and Pactor.

<can run one or two controllers at the same time, may be different types and brands>

Transceiver Control Support (if Interface between computer and radio exists)

Icom All HF radios with interface capability
Kenwood All HF radios with interface capability
Yaesu FT767, FT840, FT890, FT900, FT990, FT1000 and FT1000MP

Program Requirements

Computer 386 (25mhz) or better with 4 meg of memory
Hard Disk 4 meg of available space for installation.

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-09-02 00:00:00 UTC
From: pheezer@sprynet.com
Message-ID: <322a7e8f.54272944@news.sprynet.com>
Source record: 34861

Barry,

I hope that you see, by Interflex's responses, that they really are inflexible when it comes to their software. They obviously aren't interested in what the user community wants.

I own KaGold. Why, in 1996, it is not available as a native-Windows application is beyond me. However, the responses you've been given by Interflex may shed some light on this.

Get KaWin.

73 -

Pheezer

4716. Software for TNC's

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-09-02 00:00:00 UTC
From: clint.bradford@atdbbs.com
Message-ID: <960902001326715@atdbbs.com>
Source record: 34862

>>...that KAGold is good, but there is also Hostmaster...

If anyone asks how KaGOLD compares to other software, consider these facts:

ANSI Graphics on ALL sessions, simultaneously with KaGOLD, including
automatic capture to disk. Not supported in Host Master.

Callbook Support -- four (4) CD ROMS (Amsoft, Buckmaster, QRZ, SAM)
and SAM disk based.

Conference Mode -- Automatic, Manual, Remotely Started

External User-defined commands that allow remote users to request
callbook data, start conferences, get files, list directories, and more

Runs in Windows, Desqview, OS/2, DOS, Laptops, Desktops, 8088 through
Pentium, 16550 UART support.

Now, here are some specific things you may want to compare:

Host Master resets and disconnects all stations when it starts up.
* KaGOLD retains connects, does not reset your tnc on startup.

Host Master will not exit in any mode other than PACKET, which means
you cannot exit and leave your ARQBBS on, or leave the unit in NAVTEX.
* KaGOLD allows you to exit in any mode you wish.

Host Master has small scrollback buffers. Default is 100 lines, and the
access to the scrollback is cumbersome.
* KaGOLD has huge scrollback buffers, all dynamically allocated, and
managed automatically.

Host Master has a very limited Help "system" (screen) with no help
on modes, or parameters.
* KaGOLD has a complete cross-referenced help system that covers all
parameters and operating modes.

Host Master uses a "command channel" to set and view parameters.
* KaGOLD allows you to set/change any parameter from any screen.

Host Master has a single binary file transfer system, and only
compatible with other Host Master users. Further, it uses a "pacing"
timer approach which is inherently unreliable.
* KaGOLD supports YAPP, RAW binary, and supports the same system as in
PkGOLD for the AEA PK-232 and PK-88 tncs, and other GOLD protocol
software (dspGOLD, KaGOLD for Data Engine, etc).

Host Master has no Conference mode, and multiconnects are difficult.
* KaGOLD has manual and/or automatic conferences, allows multi-node

conferences (mixing KaGOLD and PkGOLD conferences)

Host Master does not work reliably in Windows.
* KaGOLD runs under Windows, Desqview, OS/2, DOS 2 through 6, and
in VPIX under Unix for the PC. It is "multitasking" aware.

* KaGOLD -- Reliable, fast, user friendly, more features, the best!

4717. Program for DRSI PC*Packet Adapter

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-09-02 00:00:00 UTC
From: ffes@dds.nl
Message-ID: <50ebsr$ut@news.euro.net>
Source record: 34863

Hi,

I've got the DRSI PC*Packet Adapter, a 1200 baud TNC, of a fellow amateur.
It is a 8 bits PC card, manufactured in 1989 by Digital Radio Systems.

Sa far so good, but he could find the diskettes that came with the card. He
did have the bootlets that came with the card. They include a manual of
PC/TNC. I couldn't find it on the Internet (commercial software???).

I've tried serveral other packet programs but they don't work since the
adapter doesn't use a COM-port. All I can set are IRQs (2-7).

Does anyone know a, free distibutable, DOS packet-program that does work
with this TNC?

Thank in advance, Frank

The problem with a PC is *not* the hardware, it's the OS. DOS is
more of a program loader than an OS. If you were to write your own
OS, or use a real existing OS like Linux, you would find the PC
hardware platform quite good for embedded applications.

Here is another option for you.

I write both DOS and Windows based programs.

XPKAM is the DOS program. It is designed strictly for the Kantronics
controllers.

XPWare for Windows (XPWIN) is the Windows based program. It supports
AEA, Kantronics, SCS/PTC and Hal (P38, PCI4000M and DSP-4100) controllers.
Has ANSI, binary file transfers, easy multiconnects, dx cluster support,
callsign database support (SAM, QRZ!, Buckmaster and Radio Amateur Callbook),
transceiver interface control, supports one or two controllers and more.

Full working demos are available via FTP or WWW sites shown below.

From: wb9mjn@wb9mjn.ampr.ORG
Message-ID: <10954@wb9mjn.ampr.org>
Source record: 34868

Hi Gary and Ron,

Gary, this is not a TNC. Its only 1/3 the usual value of a TNC, that is, the modem part.

This is my point exactly, with the margins so thin, the way its being done will hold it back indefinately. There is too much redundcy here. If u are going to make a radio modem, it needs to be on a band that is usable for the emission! If that s not pratical, then just make it a modem with I/Q inputs and outputs. And let the RF guys do their thing.

The old version of the DSY modem had I/Q signals between the TX encoder and the RF board. The problem was that u had to buy the 10 meter RF board. This locked the system into the very expensive transverter scheme, economically. Since u paid for the 10 meter I/Q transmitter, already.

Yes, a coherent demodulator has a longer lock up time, so what. Who said the only application for the modem is simplex packet. In Dale's own right up, he suggested using the modem for voice. At the time, this meant a 56 KB 100 % duty cycle transmission. My own ARRL CNC article explains to advantages to coherent modulation when using the modem on the transport side of the Ham Packet network. The capture ratio improvement allows for superior spectrum reuse, and the improved BER for power allows for considerably cheaper 100 % duty cycle link transmitters. Coherent recieve is even of value in some user access LANs. For example the Candian split band duplex Lans. Here, users, as well as the repeater, operate full duplex. A coherent modem would allot for 4 times less transmitter power for the downlink transmitter, if operated 100 % duty cycle. Besides closer spacing of these regenerators.

I agree, at the time it came out, the DSY modem was a heck of a deal. No longer. And without improvement in the economics of the implementation, its turning into a bad deal, slowly. I m affraid the closest analogy here is that of the Apple computer closed architecture. Its a radio modem, without the capability to take advantage of production economies of scale, that have occured in the RF chip side of things , during its product lifetime. I m disapointed that the re-make, did not consider this. And make the 10 meter RF deck, an option I wouldn t have to pay for.

>to do the job of a $100 data radio.

Gary, as you very well know, the problem isn't just ignorance.
It is not helpful to criticize someone for not knowing something.

The man bought the wrong radio, probably after spending a number of
hours agonizing over the expense, and asking around and getting opinions
from his buddies. Now he feels honor-bound to defend his choice.

What's sad here is that neither he nor his buddies knew the correct
answer - but there is no shame to him in not knowing. What's wrong
is that there are still people who don't know that the so-called
'9600 baud ready' radios generally aren't.

The shame is on the manufacturers who are duping people into buying
equipment which is unsuitable (or actively harmful) to the mode.

I would challenge TAPR, the ARRL, and any of the large packet clubs
to make it a point of honor to publish articles explaining WHY those
radios aren't suitable, and perhaps even to provide test data of
each of the various offerings.

I have not read any equipment reviews of any of the '9600 ready' radios
in QST or elsewhere. Have any of those reviews mentioned T/R delays
or PLL sweeping? Do the test labs even check those items?

Dana,

Don't take Chris too seriously he doesn't take to education too well.

Trying to educate Chris is kind of like trying to teach a pig to sing
it can't be done and it just annoys the pig. You and Gary and others
have experience and knowledge to offer don't waste your time on those
who will not hear.

I did find it interesting that a computer tech (from Chris's sig line)
does not understand collisions and service times better than he seems
to. I learned these lessons on a MicroVax I when I tried to lengthen
the disk drive data cable. The strobe reflections would take the entire
machine down.

We tend to use old Motorola rock bound radios for our 9600 baud stuff
as they are very stable and you can drop a truck on them. The test
points at the discriminator and varactor just make it even easier.
They use a lot more power than the TEKKs but I like the stability.

Now I must retire and put on my flame suit for the "Liar, liar, pants
on fire" tirade that is sure to follow this post.

One of the best deals going for WEFAX reception is AEA's AEAFAX ... it
takes RX audio from your marine/ham/sw receiver adn plugs into the
serial port of a laptop/notebook/desktop PC.

The pics are of excellent quality and it's cheap (~$100) including the
software, which allows saving images to disk, printing, and scheduling
the receipt of multiple images/maps unattended.

I used it on a two year voyage from California to Florida (with lots of
stops in all the intervening places) on my Tayana 42 sailboat and was
VERY satisfied with it.

QST has started reporting BER measurements on radios claiming
"9600 baud ready". They first did that in an article explaining
their test procedures. Most recently they published results for
the shootout among dualbanders. The results have been almost
uniformly grim.

They don't appear to be specifically testing T/R delay or PLL
sweeping. That is a flaw in their testing paradigm. But since
BER is so uniformly grim, T/R switching time is a moot point.
PLL sweeping is a more universal flaw, affecting more than
packet performance. I would expect they would highlight such
a defect as a matter of course in their routine testing of
radios. But I don't recall seeing any mention of it in tests
of radios which I know do have the problem. Perhaps this is
something that should be drawn to the attention of the ARRL
lab.

Hostmaster/Mac v2.3b works "okay" also is probably the last one Kantronics will have unless they hire a new guy who speaks Macintosh - the factory tech support line told me (about a month ago) that the last guy quit!

Is it possible to be in "unproto" mode and "cmd" mode at the same time?
Someone here said you can unproto via another stns system if he has it
set to digipeat and yet you can be connected to a 3rd stn at same time.
I use ancient software "digicom" and CBM128 TNC (read that modem).
I dont see anywhere in the ax25 protocol where it says the above is
possible, but what do I know?.

Hi Paul,

Kevin posted this message a week ago (August 26), and has already contacted "support@interflex.com" and been sent back a new user ID for the G0UZJ callsign. No doubt you posted the copy of Kevin's message by mistake, as it had no additional comments. I'm using MSN to browse the newsgroups, and it doesn't seem to have a convenient way to include the original message in the response except when using the "exchange" portion (e-mail vs. newsgroup postings).

Hope all is well with the DSP-2232 and dspGOLD.

Is there much activity any longer on Compuserve? I notice that Norm, W2JUP, is taking over the AEA questions, and that AEA has left CIS to do all of their support via e-mail and web-page news. We've dropped out of CIS as well, it seems to have been taken over by the web interest. You can't send me messages on CIS, but but you can send to me direct to "jeff@interflex.com" if you wish.

The downside of this is that unless you have a very large screen,
the fonts get too tiny to read comfortably when the window is
reduced to quarter screen, so the advantage touted becomes moot.
You can force the penalty box to use a larger font, but then you're
back to seeing only part of the text in the window. So to use this
feature effectively, you've got to spring for a big monitor (more
$$). This isn't a criticism of the program per se, just a fact of
life with reduced windows.

4749. TSTHOST V 1.43 is now released

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-09-03 00:00:00 UTC
From: kw@bigfoot.com
Message-ID: <3232cf9e.2114291@news.zetnet.co.uk>
Source record: 34886
Cross-posted to: uk.radio.amateur,rec.radio.amateur.digital.misc

Hello all,

Mario has just released V 1.43 of TSTHOST. As with previous versions,
this software is free. TSTH is a complete PMS system which works in
conjunction with FBB type BBS's in a similar manner to TPK. In my
opinion it is superior to TPK.

Those with Internet access can FTP the file from my FTP directory :-

ftp://members.aol.com/g3wcs/TSTH143

The file name is TSTH143.ZIP

Appended is Mario's UPDATE file which details the changes made since
the latest release which was V 1.42b.

UPDATES

Version 1.43
New:
+ Added capability to setup empty hierarchical routing.
+ FREVERSE command is OFF for default.
+ Added the Time remaing indication in the YAPP line.
+ Added Word Wrap control in the viewer. Toggle on-off with CTRL-W
+ Modified the display commands for unproto list: the command UL V is
removed,
all is done via the command UL L and its extension
+ Added the command EXPORT, to export the mail normally forwarded to
homebbs
into the file EXPORT.FWD in the workdir defined path.
+ New file ?????.ENT, to permits selective pms input text for
different call
+ In the directory window will be displayed the free disk space and
the space
used by the file in the list.
+ New macro command IFULSELECTED LINENUMEBER, jump execution to
linenumber if
esist one or more messages selected for reception in the unproto
list.
+ New command MSGHEADER ON OFF, enable/disable the pms message header,
(TST HOST .... LOCAL TIME .....)
+ New command CH8RESERVED ON OFF, if on, the channel 8, (or the latest
channel
available), may be connected only by homebbs or halias
+ New command UL WAITRESYNC, define the time after which, if a pending

unproto
list resync is not satisfied, the request will be repeated.
+ Added difference betwenn local and utc time in mesages header
+ New EXIT extension: EXIT @ disconnect all channels, close tsthost,
reboot PC
+ New PMS remote command /EW /ER /ED /E@. Remote shutdown
+ TSTHOST.SYS accept the new value 32 that enable the remote shutdown.
+ + and - keys in unproto list window permits gloabal select/unselect.
+ Comands EDIT and VIEW was removed, the interface DIR is now more
powerful
and permits the common files operations.
+ Insert messages filter MES_FILT.EXE
+ New macro command WAITCONN
+ Expanded SAY macro command, to accept also control characters.
+ Internal editor now accept also control characters.
+ New command CRONOFFSET, define the minuts inside hour when the cron
file is
executed
+ New command TSRMON, define an interface to an external tsr that will
receive
the monitor data.
+ New command TRACECONN, please read more detail on the manual.
Fixed Bugs:
+ Under some circumstance, and only onder os2 operating system, some
memory
byte was loss in the count of free memory. Fixed.
+ Fixed little bug in unproto list viewing.
+ Typing message title will not work keyboard loop buffer, fixed.

Im not sure what you are reading into my post...the "best equipment money can buy" for 9.6k packet, does not equat into the "most expensive"...please read agin...that is not what I said.

I find it interesting that a fellow ham entering new territory, attempts to do the best he can, with equipment advertised to do the job, is labled "ignorant" by his peers.

> Gary Coffman KE4ZV

Gary, they (the ARRL) have been advised of their omission in testing for time delays and so far they have not responded. At the ARRL Digital Ccommunications Conference last year in Texas, my DRSTM (Data Radio Standard Test Methods) project was presented as a paper. Jon Bloom from the ARRL Labs was in the audience and during the discussion following the presentation stated that he thought that the tests reported in QST did include timing tests. A few days later he contacted the presenter and confirmed that there had not been any such tests conducted. They expressed good interest in the DRSTM project. A complete copy of the

final proposed test procedure document was forwarded to them in Jan of this year. So far no comments or even acknowledgement of receipt has been forthcoming. A follow up message has also not elicited any response. It makes one think that they are not really interested.

The BER test while an excellant SCREENING test for data handling characteristics does not in any way indicate the cause or the cure to any problems that might show up as a poor BER. Likewise a minimum TXD test is only useful as a screening test for switching times. If the Minimum TXD is high, it cannot in any way indicate the cause or cure for the poor switching times. A BER test alone (like the ARRL labs have been doing) can only be of use where data systems operate full duplex with 100% key down transmit. How many such amateur radio data systems are in use worldwide????? More than the fingers on your hand???? Maybe

Interestingly the person from TAPR who responded to the proposed test procedures made the statement that in his opinion the only really important test necessary was a BER test. That shows a similar lack of understanding of the problems. Maybe these guys have been spending too much time in the lab and not enough time in the real world.

Of *course* he's ignorant, Christopher. What else could he be when
entering a new field? Everyone starting out in a new area starts out
ignorant. But ignorance can be cured, and that's what Rob and Dana were
trying to do for you, cure your ignorance and try to prevent you from
passing it on to someone else who is ignorant. Ignorance doesn't equate
to inability to learn. That's what the tag *stupidity* is reserved for.
If, after you've had it explained to you in excruciating detail why your
choice is faulty, you continue to defend the faulty choice, then *that*
is stupidity. And alas that *is* incurable, so there's no use wasting
any more effort trying.

The original question was "are there any rigs from the big commercial companies that will work 9.6k packet?" (not a direct quote from the poster)

I answered that a (my) tm-451a "will work 9.6k packet", so the answer was, and still is, yes. I also included the TXD in the post, as to show how efficent that rig is.

Now here are some added points...

Does the 451a work on 9.6k packet...yes.

Did I answer the original question correctly...yes.

Are there better radios than the 451a for 9.6k packet...yes.

Is it true that a 250ms TXD does not utilize 9.6k packet effectively...yes.

Did I already know all those things...yes.

This whole thread was a forum for some who wish to pick apart my every post, and move away from the original issue...which was the question that I answered correctly.

Take care Gary.

Ignorance doesn't equate

The primary difference that stand out the most is the BayPac units
actually make your computer act like a TNC. The downside to this is the fact
that it hogs the CPU, and to be "on the air" for any duration, you would have
a computer on, and running all the time.

A TNC on the other hand is a stand alone device. It will digi-peat, transmit,
recieve, and collect your mail with out the aid of a computer. The only time
the computer comes into play, is to interface with the TNC. As a matter of
fact, a computer is not even required to interface with a TNC...a dumb terminal
will work just fine too.

Take care.

Well, I was leafing through the May QST in the "reading room"
a while ago and noticed that they *were* including T/R time
measurements in their radio reviews (the 2m HT "shootout").
Looks like they may have been paying attention after all. No
BER numbers in this article though, but I suppose they assumed
we wouldn't try to use a 2m HT for 9600 baud. (I wouldn't.)

>choice.

Well, the cheap Hamtronics 10m->2m XV2 transmit converter and
their 2m receive converter can be used as intermediate stages.
They are not very good as a way to achieve a standalone transverter,
but they're good enough for interstage use. I took this approach to
feed a SSB Electronics 1.2 Ghz transverter. It works. Since you
have to go in and split the IF input and output of the SSB Electronics
transverter anyway, tucking the little Hamtronics boards inside is
no hardship. It works with the Down East 902 MHz transverter too.
The XV2 is a bit of overkill, it has more output than we strictly
need, but it's available off the shelf. You could slap something
together with an overtone oscillator, a DBM, and a MMIC that would
probably be better and cost less.

I know this is a kludge, but it's a cheap kludge, and a 2m output
isn't useful for the majority of transverters to the bands we use
for 56 kb. At higher microwave, faster techniques can be employed,
so use of the 56 kb modem probably isn't indicated anyway.

Some of the design decisions for the modem are somewhat USA-centric.
We've got the 219 MHz band, the 222 MHz band, and the 70 cm band
where the top speed is limited to 56 kb and the maximum bandwidth
is 100 kHz. Above 70 cm, we can go faster, and use wider bandwidths.
So we can think of using 250 kb or faster above 70 cm, IE something
like Glenn Elmore's stuff. Therefore it didn't make sense to design
the modem to easily drive transverters for above 70 cm, but make
it difficult to drive transverters for 70 cm and below where the
modem is a better fit to the regulations. Thus a 10m IF was
chosen.

As mode J users know, a 2m->70cm transverter is a bitch because
the 3rd harmonic of the 2m drive wants to feed through. And there's
nothing on the market we could use to get from 2m to 219 or 222 MHz.
There are, however, transverters with 10m IFs for all three of those
bands. And there is the low buck alternative of a low level intermediate
conversion (the Hamtronics route) for those needing the modem's external
IF to be 2m for use with higher frequency transverters.

Since ultimately the receiver uses 10.7 MHz and 455 kHz IFs internally in the modem (to let it use an inexpensive 455 kHz LC IF filter design with suitable phase linearity and passband characteristics for our signal, which incidentally was one of the toughest things to achieve in the original design within the cost parameters), if an extra conversion had been put inside the modem, it'd have been triple conversion, which adds cost and more possibilities for unwanted mixing products. Since those who need it can just as easily put that extra conversion external, and leave us with only one modem board to stock, that was the route taken.

The transmit side could have been made to output on 2m by using DBMs instead of 1496 balanced mixers. But that would have required an oscillator multiplier chain with more LO output instead of the simple 29 MHz oscillator used (original modem), and more post mixer gain would have been needed. That would have driven up costs (not a lot, but a few bucks here, a few bucks there, it adds up). Again an off the shelf external conversion stage is more cost effective, especially since most users won't need it.

And if we did make it 2m IF, we'd just buy the Hamtronics boards and tuck them inside the regular modem at the factory and charge you extra for our trouble. Why not cut out the middleman and do it yourself. :-)

I know there are a lot of different ways to do a quadrature modulation RF modem today. For some uses, some available chipsets would have allowed a simpler cleaner design. But remember that this basic design dates from 8 years ago when those chipsets weren't available, and in the quantities we have had to buy, it wouldn't have been cheaper.

This latter is absolutely critical to understanding the pricing on this unit. When we were doing kits, we'd use the money from sales of one batch to finance the parts for the next batch. We couldn't buy in quantities where we'd get the big price breaks. Now Dale has added a bunch of features, a nice cabinet, and assembly costs (which I fully support, the number one thing hams have asked for is an assembled version). I still think it is attractively priced compared to the competition, IE stacks of slower equipment used in parallel.

Note: I've used "we" a bit in the last few paragraphs, but I want to make it clear that this is Dale's baby, he made all the design decisions, GRAPES did the kit work, and I just threw in an oar now and then in support of what they were doing. I'm specifically not taking credit (or accepting blame) for anything associated with this RF modem (except the tutorial video, that was *my* baby). I do have a close up view, and hope I've illustrated some of the tradeoffs that went into this project as I see them. Dale and the GRAPES board may have other opinions.

(I'm no longer on the GRAPES board, though I continue to lend
my support to what they're doing. And I'm waiting like the
rest of you for my *new* 56 kb modem.)

You must have missed all the attempts that have been made on this newsgroup, in packet radio bulletins, and in QST (5/95) to explain that the equipment advertised as "9600 baud ready" actually isn't.

Also, it often seems that amateurs tend to believe such a claim in a commercial advertisement, and tend to disbelieve claims from their fellow amateurs who happen to have tried it and found it was not true.

This is unfortunate, and not only for their own wallet but also for the efficiency of packet radio as we all use it.

When a reasonably well documented article like the one in QST fails to hit the brains of the newcomers, we have a problem. Plainly stating "what Kenwood tells you is not true" is not going to make much impact, and I doubt any amateur is interested in going through a legal case against the radio manufacturers and distributors about making false claims in their commercial advertisements.

4763. Re: Software for TNC's

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-09-04 00:00:00 UTC
From: wrt@eskimo.com
Message-ID: <322ce333.10655601@eskinews.eskimo.com>
Source record: 34759

Please allow me to add two comments to the thread:

1. Several postings have said Hostmaster II+ is not stable running under Windows. This is not true, in my experience. I ran it for about three years under Win 3.1 and have run it under Win 95 for about 10 months. It has been perfectly stable under both versions. If someone has problems, I would suspect their PIF file or shortcut parameters are set incorrectly.

2. One drawback to all the true Windows programs is the reduction in space available for text due to the scroll bars. Hostmaster II+ has it's windows (small w) cascaded from top to bottom with no borders at all - maximum space available. If you've never used a DOS program you probably wouldn't complain, but if you have, it's one of the first things you'll notice. The way I use Hostmaster II+, there are seven windows in use at once: Menu bar, monitor window (unconnected packets), data window (connected packets), HF xmit echo window, HF data window, status window and keyboard input. If I try to do that with a true Windows program, each window becomes very small and text rapidly scrolls off.

I admit that Hostmaster II+ does have some drawbacks - small scrollback buffers is one I'd like to see corrected - but I've tried 'em all and always end up going back to Hostmaster. Don't get me wrong about Windows. I use it all the time at work for word processing, spreadsheets and the like, but for a TNC program, I feel DOS is better, whether running under Windows or not.

The 451a IS "9600 baud ready"...but it just doesnt do the job as well as some
other rigs.

>Also, it often seems that amateurs tend to believe such a claim in a
>commercial advertisement, and tend to disbelieve claims from their fellow
>amateurs who happen to have tried it and found it was not true.

I have never experienced this.

>This is unfortunate, and not only for their own wallet but also for the
>efficiency of packet radio as we all use it.

Actually, the money can be considered well spent by some.

One can spend $400 on a radio that can do voice, 1.2k packet, and 9.6k
packet...on ANY frequency of his choice, verses a $150 rock bound rig that
can only do one thing, on one frequency.

It really depends on the person, and how they intend to use their equipment.

>When a reasonably well documented article like the one in QST fails
>to hit the brains of the newcomers, we have a problem.

Are you slamming hams who dont get, or read QST magazine? Are you
saying that it should be some sort of requirement to read QST?

>Plainly stating

Very true. I cant afford such legal fees, however, if I ever bought equipment
that didnt do what the manufacturer claims, and they didnt make it right, not
only would I never buy anything from them again, I would spread the word on
them as well.

Take care.

You guys are really wasting your time here. After all the discussion he still doesn't get it. It's unfortunate but this attitude reflects that of a significant number of hams - "I bought it so it must be good and since I have it now it's good enough. I don't care how it affects others". It's that attitude that keeps amateur radio stuck in the stone age. It's what makes 1200 baud packet run at 30 cps and 9600 baud packet at 120cps. It's the same attitude that keeps us from proliferating new standards at higher bit rates. But.... he's happy with what he's doing (I think) so let it rest. Just don't put a packet station on the same frequency he's on!

You did say your TM-451A operates "flawlessly" at 9600 baud. Most
normal people would interpret that as something better than "good".

>>But.... he's happy with what he's doing (I think) so let it
>>rest.
>
>Yes...I am happy to enter into the higher baud rates of packet, however, as one

I suppose this is where the controversy is - someone asked if a PLL
radio can be used for 9600 baud and you answered "my TM-451A works
flawlessly". If it were just a matter of what you used at your station,
it wouldn't be worth the effort - if you want to use an inferior radio
that's your business. But, you wrote a note to the Usenet telling
other inexperienced operators that your TM-451A works "flawlessly".
If someone is starting out, they've got a chance to select a much
better radio for 9600 baud, but they might not after seeing your note.

So, the issue is primarily the fact that you've been encouraging others
that are just starting out to make a poor choice for radio gear.

>>Just don't put a packet station on the same frequency he's on!

>flawlessly". If it were just a matter of what you used at your station,
>it wouldn't be worth the effort - if you want to use an inferior radio
>that's your business. But, you wrote a note to the Usenet telling
>other inexperienced operators that your TM-451A works "flawlessly".
>If someone is starting out, they've got a chance to select a much
>better radio for 9600 baud, but they might not after seeing your note.

As stated above above (which you conveiently exclude), I posted additional
information in the original reply, including the TXD...which will give a
clear indication of its preformance.

>So, the issue is primarily the fact that you've been encouraging others
>that are just starting out to make a poor choice for radio gear.

Again...the question was, will any PLL rigs from major manufactuers work
on 9.6k packet...the answer is yes...a (my) tm-451a "will work" on 9.6k packet.

I never said it was the best rig to use...I answered his question.

>I don't know, Chris - how abot a ham that gives flawed advice and
>then argues with everyone that disagrees? ;-)

I argue with no one, and never gave "flawed advise". You are the one reading
what you want into my posts (and I think I know why).

But anyway, how about a ham who calls names when he cant debate/comment
effectively, do you know of any "strawman whiners" that come to mind Dana?

Take care.

>Vy73 de YANN - F1NGP
>Yann.Weber@wanadoo.fr

The 1200 baud pacsat *downlink* modulation is PSK. You need a PSK modem
to receive it. RadioKit had a kit, JAMSAT had a kit, TAPR had a kit
(reputed to be a bit better than the others due to use of a Costas
loop instead of a squaring loop for clock recovery), and PacComm has
them wired and tested, ready to install into your TNC2, or a complete
package already installed in a TNC. You need a SSB receiver to receive it.

For uplink, you use Manchester coding through an FM rig (or subcarrier
modulated through a SSB rig), the above modems take care of this for you
too. They also have doppler tracking via the UP DOWN tuning interface
for Icom, Kenwood, and Yaesu radios.

(Note, the 9600 baud sats use the G3RUH modem same as we use terrestrially.
PacComm offers a package for that too, don't order the wrong one.)

The late lamented _Ham Radio Magazine_ had the original construction
article for the PSK modem (the JAMSAT version). If you can find someone
with the back issues, you might be able to scratch build it from a
photocopy of the article (no exotic parts are needed).

Or if you have a DSP board, you can just program the modem on that.
I believe there is sample code on the TAPR website. And AEA's DSP
product has the appropriate modem already coded.

Why bother with that overhead? Just code your application in ROM
and pop it in the motherboard's ROM sockets. Done. Low end motherboards
with on board parallel ports are so cheap, you can't build up a dedicated
controller card for less. If you can't fit a repeater control program into
the motherboard ROM space, you're trying to get *way* too fancy.

>I'm looking for people using TEKK-900 or TEKK-960 radios. Please write
>me you experiences!

I've got a couple of KS900s. There isn't much to tell. Wire it up
to the TNC (D connector on radio), hook on an antenna (BNC on radio),
feed it power (*must* be less than 11 volts, I use 9 VDC regulated),
it works.

There are a couple of things of note. *Obey* the power supply
voltage limit. They aren't kidding about keeping it below
11 volts. And if you don't have a spectrum analyzer handy,
let the factory crystal it up and tune it for your frequency.
It's easy to get a spectrum like a comb out of this thing if
you tune it wrong.

Hi,

Just to announce a new version of the Pescador program has been uploaded
and it's available at ftp.funet.fi/pub/ham/packet/terminal as PESCAV1F.ZIP.

This program allows the capture of mail forwarding just with a passive
monitoring of the channel, both W0RLI (non-compressed) and F6FBB
(compressed) formats are supported.

The captured mail is made available for import into a BBS.

Please comments and feedback thru this group or directed to
colla@pec.pccp.com.ar.

Best Regards.

I've used Hamtronics for several receiver and transverter projects and
think they are great in the performance/price ratio. No, they're not
"bolt-in" (except for the factory-wired units) and yes, they need some
RF expertise to optimize, but for the price they do a great job.
(I've obviously made and marketed kit projects of my own and have high
admiration for those who have kept at it more than a year)

Hello!

You are invited to participate in the most exciting telecommunications
MLM opportunity! FreedomStarr Communications, Inc. (FCI),
proudly announces our "Share the Wealth" true residual income
program that will go RIGHT ALONG with any MLM program you're
participating in currently, and any business venture you undertake at any
time in the future. It's free! No Cost - No Work - No Risk! FREE
Web Page and a low-cost Internet Package, plus more!

As an FCI representative, you have the chance to build a truly long
term, year-after-year, monthly residual income, with minimal effort. With
the TOLL FREE, 24 HOUR AUTOMATIC VOICE MAIL SPONSORING SYSTEM,
you may build an EFFORTLESS, UNLIMITED RESIDUAL INCOME in the
$100+ BILLION per year telecommunications industry.

Imagine earning a steady, long-term, monthly residual income check
from the long distance telephone usage of THOUSANDS of other
people! If you were to refer just 4 other people to FCI by having them
call our Toll Free Recorded Hot Line, and they were to duplicate your
efforts, you will have built for yourself an ongoing monthly residual
imcome of over $4000!!!! (This is based on a smaill $20.00 average
monthly interstate long distance phone bill). You can imagine the
potential!!!!

And, here's the best part - our RECORDED INFORMATION &
REGISTRATION HOT LINE WILL DO ALL OF THE WORK FOR YOU!
Our state-of-the-art 800 Voice mail System can handle up to
256 SIMULTANEOUS CALLS from every state in the nation!

Call FCI's state of the art FAX ON DEMAND system first and see how
EASY and POWERFUL this GREAT once in a life time opportunity can
be! CALL the fax at 619-432-9700!!!

The Fax on Demand is less than 10 pages. You must use your hand set
and the fax must be in manual mode when you call.

This means that this program is perfectly suited for the ELECTRONIC MARKETING that you could or and ALREADY doing.

$$$ Call the FREE information HOT LINE NOW to find out how to get your ID# registered FREE! and find out more about this one in a LIFETIME GREAT OPPORTUNITY! It's a FREE call, and it's FREE to join! What do you have to lose! $$$$

1-800-223-6477 (Sponsor #: va1123581)

Your FCI ID# consists of the FIRST 2 LETTERS of your LAST NAME, followed by the LAST 7 DIGITS of your social Security Number. For Example, if your name is Tom James, and your SS# is 123456789, then your FCI ID# would be: JA3456789 (NOT TJ3456789).

After your registration phone call, you may IMMEDIATELY begin referring others to the same toll free phone number, and get credit for those referrals, through 6 computer-tracked levels of your growing organization. In 2 to 3 days, you will receive more information, registration forms, and a sample FCI glossy brochure in the mail.

Every month, you may receive a printed down line report showing every person who has called using your sponsor ID#, and every person signed on from levels 2 through 6.

This is the OPPORTUNITY OF A LIGETIME! You'll be one of the FIRST 1000 PEOPLE IN THE U.S.A., which means that your chance of earning a SERIOUS MONTHLY INCOME in a very short period of time is very realistic! We are looking for individuals such as yourself, to reach our goal of 50,000 representatives by January 1, 1997.

Here was the clincher for me! U.S. Residents note: In order to be a part of this outstanding program you DO NOT have to switch your Long Distance sservice to FCI, if you are getting a better rate, or the phone is not in your name, or for whatever reason you have. (You can prove a better rate by submitting a photocopy of your bill). If your are not switching carriers you only need to remit $20 (annually) for YOUR monthly down line report.

MORE INFORMATION FOR YOU:

Overview: Who is 1)WilTel, 2) UniDial, and 3) FCI?

1) Founded in 1985, WilTel owns and operates a nationwide fiber-optic network, on of only four in the United States, with access to more than 30,000 system mils. WilTel pioneered the techinique of pulling fiber-optic cables through decommissioned oil and gas pipelines. This approach results in the most secure routes in the industry, and as a result, over one half of the U.S.A.'s Fortune 100 corporations trust and utilize WilTel as their long distance carrier. as a full service telecommunications company, WilTel provices data, voice, and video products and services worldwide and is currently the fourth largest long distance carrier in the U.S.A.

2) UniDial, Inc. is the largest re-seller for WilTel, having signed a $480 million long-term agreement on June 5th, 1995 - the largest ever in re-seller history. this strategic partnership demonstarates UniDial's aggressive plan to penetrate the re-seller market, which is growing by leaps and bounds. In 1994, the re-seller industry reached $8.25 billion, and is expected to increase to more than $12 billion by 1998.

By taking advantage of UniDial's massive buying power, individuals such as yourself now have access to a fabulous new long distance rate. If you are currently using AT&T, MCI, Sprint or onne of the other long distance services you might by paying as much as 27 cents per minute for your long distance calls.

You may now call anytime, for 12.9 cents per minute (Interstate) with absolutely no minimum commitment and you don't have to wait until 5:00 pm to get this great, low rate! Also, there will be no change in the way you place a long distance call - just dial 1+ the area code and phone number.

The UniDial "Global Axcess" Communications Card is now available. Features include with the Global Axcess card are 800# Voice Mail, Fax Mail, international calling (at savings up to 55% savings over AT&T, MCI, and Sprint), Speed Dialing, and Coference Calling without an operator. You can use the Axcess card from any of over 30 foreign countries. this is what I call a company that listens to the needs of entrepreneurs like us.

FreedomStarr Communications, Inc. is a telecommunications network marketing company representing UniDial, Inc. Our firm provides marketing support and an ingenious distribution mechanism to a network of independent "customer/representatives" all over the United states of America.

FCI offers US citizens a very simple, yet powerful way to both save money and earn a substantial long term residual income in the exciting telecommunications industry, with very little effort aside from sharing a toll free recorded hot line phone number with others. Because of the simplicity of FCI's Share the Wealth program, no sales ability of experience is required. In fact, you may build your income without ever speaking with another human being! This revolutionary new concept is taking the nation by storm, and we welcome you and invite you to become a part of our success.

**** YOUR SUCCESS IS OUR SUCCESS ****

We, the Ventura County ARES Area 6 Packet Radio Training Group have created a download-able version of our manual on the World Wide Web.

We hope you enjoy the manual as much as we have enjoyed putting it together, and please feel free to pass it along to all interested in packet radio. It is our intention to make this material available to anyone who desires to have it. You may freely make copies and distribute
it, hold classes using it, modify it and train from it, etc.

We are giving this freely to the ham community to promote the free exchange of information and fellowship among hams. We hope you also see fit to pass it on in the same spirit. You will find it at:

http://www.fishnet.net/~dlmiller/packet.html

This is an HTML version of the hard copy reference manual which we use in
our Packet Radio Training Course.

For questions and/or comments about this web page or the class which we teach, please send a message to one of the following:

In <cgreenha.478.322CF8A6@magnus.acs.ohio-state.edu> cgreenha@magnus.acs.ohio-state.edu (Christopher K. Greenhalgh) writes:

>The 451a IS "9600 baud ready"...but it just doesnt do the job as well as some
>other rigs.

It only IS 9600 baud ready in YOUR opinion, and possibly Kenwood's.

>>Also, it often seems that amateurs tend to believe such a claim in a
>>commercial advertisement, and tend to disbelieve claims from their fellow
>>amateurs who happen to have tried it and found it was not true.

>I have never experienced this.

On the other hand, you are yourself a prime example of the above.

>>This is unfortunate, and not only for their own wallet but also for the
>>efficiency of packet radio as we all use it.

>Actually, the money can be considered well spent by some.

>One can spend $400 on a radio that can do voice, 1.2k packet, and 9.6k
>packet...on ANY frequency of his choice, verses a $150 rock bound rig that
>can only do one thing, on one frequency.

>It really depends on the person, and how they intend to use their equipment.

The money would be better spent on a previous-model transceiver (second hand, or special offer by the hamshop because they can't sell those "not ready for 9600" transceivers anymore) plus a dedicated data radio.

>>When a reasonably well documented article like the one in QST fails
>>to hit the brains of the newcomers, we have a problem.

>Are you slamming hams who dont get, or read QST magazine? Are you
>saying that it should be some sort of requirement to read QST?

No, I am assuming that the newcomers can't read. And you show it very well by asking the above question.

>>Plainly stating
>>"what Kenwood tells you is not true" is not going to make much impact,
>>and I doubt any amateur is interested in going through a legal case
>>against the radio manufacturers and distributors about making false
>>claims in their commercial advertisements.

>Very true. I cant afford such legal fees, however, if I ever bought equipment
>that didnt do what the manufacturer claims, and they didnt make it right, not

>only would I never buy anything from them again, I would spread the word on
>them as well.

That is what I am doing. I will not buy Kenwood equipment, and not only
for the reasons discussed in this thread.

Unfortunately for you, you did not know about that. And you did read the
advertisement by Kenwood and/or the recommendation by a hamradio shop
whose owner probably isn't even active on packet radio. Pity for you,
and all the other packet radio users on your channel (and the channels
close to it).

Hi,

If you know how to make the Yaesu Ft-5200 operational on packet
at 9600bps (Where do I connect the tx/rx wires) could you please
send it to me?

Thank you.

>Thanks 73 -Rob-

While I haven't tried it, I'm pretty certain that trying to
run 19k2 GMSK through a stock Mitrek isn't going to work very
well. It might actually fool you into thinking it is working
acceptably on the bench with strong signals - but there's
no chance you could use this in the real world.

However, any radio that works at 9k6 using the common
"2 level" GMSK (TAPR, G3RUH, K9NG, etc.) would probably
work well at 19k2 using a 4 level modem like the MX909 from
MX*COM. The 4 level modem encodes 2 bits per baud, so the
bandwidth is about the same. The downside is that you'd
have to build your own modems for all the nodes, but it is
probably better than butchering the excellent Mitrek radios.

4799. Need help on decode digital signals on HF, and if possible others freq's also

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-09-05 00:00:00 UTC
From: miguelm@mail.telepac.pt
Message-ID: <50ntn1$vh6@duke.telepac.pt>
Source record: 34709

1 - I 'am a SWL (HF). normally BBC WS, (not allways - becouse the only radio I have it's a sony icf-sw10)

2- ... and i also listen digital signals on that freq.'s ...

3 - .. and ... I'am also tired of listen those signals. (the Digital signals)

4 - So now, I want to silence the speaker and decode those signals!!!

Questions

1 - How I do it?

I know i need a better radio, and a interface to connect the radio to the PC, some software, But ... what to buy?

For me the best radio, I have look when searching on WWW, was the Drake R8A, or the Kenwood ??? ... something, I do not remenber what.

The Kenwood are not bad, but need some extras, for example for connect to the PC, and others like filters.

For software I find that the AMSAT site have many things for hams, that are also good for help me on this task.

So now I need to know what I'am gone listen, I know I can listen to weather sat's, but do I need to do some modifications on the radio? what's the RTTY, FAX modes and what can I "listen" on those modes, is there any others modes available...

... and if when I install ALL the equipment, it doesn't burn the board of my PC, or the radio.

I say this because someone in the rec.radio.* groups sayed that it can happen. how true it's?

An other thing I like to know is if it's possible to decode NOAA sat's digital signals, it seens that those sat's are Weather sat's, so any help on decode signals from that sat's will be very much welcome.

Like you can see, for now the first thing to do, it's to buy a better radio and make the connection to the PC, but i do not want to jump on this hooby, without know more of what can I do.

BTW, any books on the subject are welcome (electronics, HAM, sat's, etc----> related with radio communications, off course)

Thanks in advance

Not Really! The 736 should put out 25W on 6. The older 726R put out
10W. The 736 1.2Ghz module is around 10W out.

I'm interested in experiementing with packet radio, but don't have big bucks to dump into it. I have an interest inthe BP-2 or BP-2M from Tigertronics. I would like to connect it to my ICOM HT for packet and the Kenwood R-2000 for WEFAX. A couple of questions:

1) Does the TNC come with a cable that will attach to both these radios?

2) If not, who can I call regarding which cables to connect the TNC?

3) Are there any real drawbacks with using the BP-2M?

Thanks!
Tom

The original question was:

----- Beginning of Included Original Note -----
Subject: PLL Radio for 9600 baud packet?
From: Dr Tony Farrow <tony@mpce.mq.edu.au>
Date: 1996/08/27
Message-Id: <322341F8.4DC7@mpce.mq.edu.au>

Hi all,

Can anyone recommend a brand of 70cm radio from any of the major
ham-radio manufacturers that is really suitable for 9600 baud packet? I
wonder if there are any PLL sets that are satisfactory?

Thanks & Cheers,

Tony vk2tjf
----- End of Included Original Note -----

It is just amazing what one can find with Dejanews and AltaVista...

So, the actual query was for a brand of 70cm radio from a major
manufacturer that is *really* suitable for 9600 baud packet.

As has been clearly established, a TXD of 250mS makes a radio
unsuitable for 9600 baud packet use, not to mention the
potential for interference to other channels as the PLL
settles down.

[...]

>I never said it was the best rig to use...I answered his question.

Upon looking at the actual question again, it would appear that
you didn't answer it. He was asking what rigs were *really*
suitable, not which rigs can work with an unacceptably long TXD.

[...]

>But anyway, how about a ham who calls names when he cant debate/comment
>effectively, do you know of any "strawman whiners" that come to mind Dana?

Hey, I think you've been throwing up strawmen ("Whatever you say Dana",
"I apologize for not starting out with the best radios money can buy")
and whining while avoiding the truth (which is a TM-451A is *really*
not suitable for 9600 baud packet). If you think I'm calling you
names, that is a personal problem. I'm just calling it the way
I see it.

The only reason I've attempted to engage in this discussion at all
is to hopefully prevent some other amateur from following your
flawed advice. If you want to believe that your advice was correct
and valuable, feel free, but you're not doing anyone a service.

Hello...

I was wondering if there is anyone out there reading this mailing list/newsgroup that has gotten TNOS 2.10 running successfully under FreeBSD? To qualify, I finally figured out that I can attach a ppp process to a virtual port via ijppp but not SLIP. Is anyone doing this? Does it work? I can get the ppp daemon to camp on ttypf and have configured TNOS to open a PPP connection to ttypf but I can't get the UNIX side to talk to the TNOS side at all. If you are running the above configuration and have it working as a full gateway, I would like to hear from you.

From: flywheel@taunet.net.au
Message-ID: <50mc1h$3q9@pellew.ntu.edu.au>
Source record: 34791

Gary,

Thanks for your advice. I had already tried using a
shunt resistor and series capacitor on the output of
the Kendo, with no improvement in the appearance of
the TNC's lights. I can use "brute force" to get
the lights to look centered by forming a high-pass
filter with a small series cap and small shunt resistor
across the TNC input. But still no improvment in the TNC's
performance. As far as "common" connections go, there's
only one on the TH-79, on the speaker output.

Several nights ago I noticed an interesting phenomenon.
I was connected to VK8BBS and simultaneously monitoring
all packet messages. Another user was doing some kind
of long listing, and my TNC copied it perfectly. Now, if
those packets had been addressed to me, my TNC would most
likely have tried to ACK after three or four packets, even
though the BBS was still transmitting. I'm beginning to
suspect that the BBS pauses briefly between consecutive
packets, and that makes my TNC send a premature ACK because
it thinks the channel is clear. I've spent some time playing
with the RESPTIME parameter, but I don't think I've seen any
improvement. The search continues....

Gary.

In article <50m8jo$nos@abyss.West.Sun.COM> myers@West.Sun.COM (Dana Myers) writes:

>Can anyone recommend a brand of 70cm radio from any of the major
>ham-radio manufacturers that is really suitable for 9600 baud packet? I
>wonder if there are any PLL sets that are satisfactory?

>So, the actual query was for a brand of 70cm radio from a major
>manufacturer that is *really* suitable for 9600 baud packet.

He also asked if there are any PLL set that are "satisfactory".

>As has been clearly established, a TXD of 250mS makes a radio
>unsuitable for 9600 baud packet use, not to mention the
>potential for interference to other channels as the PLL
>settles down.

"Clearly established"? By who?

>Upon looking at the actual question again, it would appear that
>you didn't answer it. He was asking what rigs were *really*
>suitable, not which rigs can work with an unacceptably long TXD.

And again, in his second question, his words were "satifactory".

>If you think I'm calling you
>names, that is a personal problem. I'm just calling it the way
>I see it.

Well I hardley think of it as a "problem"...I couldnt care less that you
call me names. I dont let it bother me, and refuse to lower myself to
that level, thank you.

>The only reason I've attempted to engage in this discussion at all
>is to hopefully prevent some other amateur from following your
>flawed advice. If you want to believe that your advice was correct
>and valuable, feel free, but you're not doing anyone a service.

I answered his question accuratly.

Actually Ron it is more than defending his purchase. Chris has never
been wrong. He thought he was once but that turned out not to be the
case. Once Chris makes up his mind he doesn't get confused by facts or
expert opinions. "I said it, I believe it, that settles it." As long as
anyone argues with him he will spew his nonsensical defense. Gary is on
the right track, he doesn't have a clue, he doesn't want a clue so
don't waste any more time or bandwidth on him. Maybe then he will go
back to alt.mcdonalds and alt.politics.homosexuality. Yes Chris you do
post to these groups; before you deny it you might want to check
Dejanews it's quick, easy and there you are.

Pity ... I guess nobody around here knows that Host Master of Macintosh
was NOT written by anybody at Kantronics .... it was written by Kevin
Krueger - N0IOS and ... he's also the fellow who wrote the contest
logging software called: Marathon for Macintosh (it's wonderful!!)
and, he wrote ONLY the most recent version of MacRatt (III) for AEA.

I'm sure he'll just love that I mention it ... but, Kevin's email
address can be identified, I'm pretty sure, by some of the on-line
callbooks that also list email address. I don't know that he
would be excited to spend his life providing technical support ...
after all .... I seriously doubt that he does or was paid by
Kantronics to do anything more than write the program and the
manual.... the expense burden of providing technical support
goes to the retailer of the software, generally speaking.

In any case ... if you own a Mac and don't have logging software,
(especially for contests) check out Marathon - I really, really
like that one and can use it, with limited data entry as a
general purpose log .... but it wasn't designed to do that.

Cheers
Sandy WA6BXH
Portland, Oregon

PS: I AM an unabashed and unashamed enthusiastic supporter of
Kevin Krueger -N0IOS as he is one of the all-too-few hams
writing commercial grade software for us Mac-weenies. ;-)

Well, I'm using the SSB Electronic UEK3/USM3 23cm converters, modified
for 28MHz IF. I had to install stripline filters in front to get enough
suppression, though.

> 2M IF would be ideal of course, but not achievable with current
> component choice.

Agreed. A 2m IF would have saved me a lot of work (modifying the
transverters, designing and building the filters).

BTW, SSB Electronic also offer 10M <-> 2m converters. I don't know
whether they can do full duplex.

I recently contacted Paccom to buy several units of Gracilis Packet Ten network switches, but was disappointed when they said in the fax-reply that their P10s are unavailable. I have repeatedly tried to contact them again about this to ask when will they have P10s available, but have not received any reply.

I was wondering if anyone can tell me other suppliers of the Gracilis P10. Our agency is setting up several of this here in the Philippines.

Hello !

How I understand from QST/News articles realy good for 9600 Packet radio's
are: TEKK, Azden PCS9600D, Kantronics D4-10, IC820.

Radio's named "9600 Packet Ready" also can be used for 9600 with
more higer Txd, BER, so with low CPS.

The best radio (I compare BER printed in QST) from the list of "9600 Packet
Ready" is on the top of table.

dual band 2m band

FT8500 TM251
TM733 IC281
C5718 FT2500 (need mods)
DR610

Is there who also realy compare radio's and can say, which radio from
"9600 Packet Ready" is the best ?

Victor

4828. RE: Need help on decode digital signals on HF, and if possible others freq's also

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-09-06 00:00:00 UTC
From: interflex@msn.com
Message-ID: <00001fec+0000182f@msn.com>
Source record: 34724

Miguel,

The simplest way to decode non-voice signals is with a TNC (terminal node controller). Many SWLers use KAMs (we sell KaGOLD, software for the KAM, and have a number of SWL users). You will also find PK-232s in use, as well as MFJ tncs. I would suggest the KAM based on features and price.

There are MANY encrypted transmissions on HF bands that you cannot decode, which is discouraging for those who get a TNC and try tuning whatever they hear. I would suggest starting with amateur transmissions.

1. Tune in the ARRL "teleprinter" bulletins. If you can access the web, try http://www.arrl.org/w1aw.html for a list of times and frequencies.

You will see that bulletins are sent simultaneously on several frequencies: 3.625, 7.095, 14.095, 18.1025, 21.095, 28.095 MHz.

Bulletins are first sent using 45-baud Baudot. Then they are retransmitted in FEC AMTOR, and if the messages are not too long, you'll hear them being sent using 110-baud ASCII.

2. Tune in the ARRL "morse code" bulletins, code practice, and qualifying runs. These are sent on 1.818, 3.5815, 7.0475, 14.0475, 18.0975, 21.0675, 28.0675 Mhz at different speeds, depending on what is being sent (code practice, qualifying runs, or bulletins).

Once you get the idea how to decode and print the ARRL transmissions, you can start monitoring the amateur bands for other digital transmissions.

The amateur "band plan" can be reviewed if you can browse the web. Try http://www.arrl.org/field/regulations/allocate.html

Also try: http://www.interflex.com (web page for KaGOLD/PkGOLD) and try: http://www.kantronics.com (KAM tnc manufacturer)

There are many other amateur radio resources on the net.

Have fun,

Jeff, WA4EGT
InterFlex Systems

>
> "Clearly established"? By who?

By almost anyone that's used 9600 bps effectively...
You can send 2400 bits of data in 250 mS, that's 300 bytes of
information. That's a lot of wasted bandwidth if you can't get
your radio to key up (and recover) any faster than that.
You really need to be down to at least 30-60 mS if possible.

<meaningless finger-pointing eradicated>

It's cheaper to just buy $100 Tekks and not have the problem
anyway... Even with an external amplifier, you can still get
sub 100 mS performance.

> a working standpoint.

We have several 451s in our packet network.
We are replacing them with other radios (TEKK or D4-10)
just as quickly as we can.

Why?

Under the very BEST operating conditions, the 451 can be
made to run at a TXD of about 125 Ms.
This is WAY too slow.

We run the TEKKs and D4-10s at txd of 50-60 on good links,
80 on bad (i.e. long haul) links, and think that THESE
values of TXD are way too slow ...

The 451 just does not work very well at 9600 ...

"Flawlessly" is certainly not a term one might ever apply
to 9600 baud operation of any PLL radio I've encountered.

The good news is that you can purchase a couple or three
TEKKs for the money you get when you sell the 451 ...

If by that, you mean Hostmaster looks like the author didn't
"know all about Macs", then I agree. Hostmaster is better than
some others I have seen, but when it comes to Macintosh, I've
NEVER EVER seen any amateur radio packet software that even begins
to use the power of a Macintosh. It all looks to me like DOS living
in a Mac window. If you haven't used a recent vintage Mac with REAL
Macintosh application software, then you haven't SEEN a Mac yet.
Sure wish I was smart enough to write some of for packet.

Use a Mirage D15 amp. Provide about 15 watts out for 3-5 in. Has PIN diode
T/R switching. Two of these back to back with the Tekk gets us a 30ms TXD.

The advice I was given was to use the PTT signal from the modem/TNC
to switch the PA. In other words, connect both tx/rx switches to the
PTT line on the modem and set your TxDelay for the slower one (probably
the radio, unless you're using a relay to switch the PA). This way,
by the time the radio has started to transmitter is stable and on
frequency, your PA should also be ready.

I haven't tried this yet, but it makes sense.

regards,
Dean.

: I would like to know a little more about ACARS Monitoring. Specifically HF
: ACARS and if the KAM will support it. I did a search on HOTBOT and LYCOS, but
: didnt come up with much usefull. Is it a packet mode (or at least a data mode
: of some type). Thanks in advance.

Ricky,

As far as I know ACARS use only VHF-AM between 129 - 132 MHZ.

I have been using it for a while and enjoy it, the receiver is a PRO-43
handheld scanner by Radio Shack and the computer is a XT Laptop TANDY 1100FD
It is a sort of packet but different than the one used by hams. You will
need a special decoder, I use the one made by AEA, it attaches to the serial
port of my laptop and is about the size of a 25 pin plug.

Hope this helps,

Gilbert VE6GES.

Hello... I'de just like to make a suggestion about all you wanna-be packeteers like me... if they're all like mine, DON'T BUY AN MFJ READY-MADE cable, unless you want to do some SERIOUS re-wireing... I'm really getting fed up, and I've heard I'm not the first. none of the wires were connected right... If anyone has an address for MFJ complaints, I want it... e-mail or snail mail... I'de of been better off building my own!!! at least I'de of know what color wire was what.

P.S.- anyone know the wiring for this??? I'm still trying to get it up and running.

>Gary,
>It's good to hear your experience on the Hamtronics - Thanks. I've looked
>at their stuff but heard negative reports about the receive converter. For
>the price it's probably worth checking out.

Yeah, it works. There are a couple of caveats (of course). I wouldn't
want to use the Hamtronics XV2 or 2m receive converter directly on the
air. You need some filtering between them and the world. For this use,
however, they'll do. The other caveat is that the LO in the receive
converter is finicky to get tuned up right. You can all too easily
get a comb spectrum out of it. Tuning with a spectrum analyzer, you
can find a point where it is clean and still starts reliably. But
the comb spectrum isn't much of a deficit in this intermediate stage
use. The filtering before and after it will make the spurious products
low enough in level not to be a serious problem. (I still suggest
you make the effort to get it tuned clean, however. That *won't*
be at the point of maximum output.)

If you don't mind rolling your own, you can use a SBL-1 and a good
clean easy starting Butler oscillator circuit instead of the Hamtronics
kit. Other than the hassle of scrounging the parts, it won't cost more,
and will very probably work better. An intermediate conversion stage
can be simpler than a complete transverter or converter because the
stages before and after it do some of the work of filtering the signals,
and the NF of the conversion doesn't have to be so good because the
preceeding stages will have set that. This lets you keep things simple
and cheap.

>Kenwood R-2000 for WEFAX. A couple of questions:
>
>1) Does the TNC come with a cable that will attach to both these radios?

No. Icom and Kenwood radios are wired differently.

>2) If not, who can I call regarding which cables to connect the TNC?

Just make your own. It isn't rocket science, and the connectors you
need are available at Radio Shack. If you are, as you say, on a tight
budget, it makes no sense at all to buy premade cables.

>3) Are there any real drawbacks with using the BP-2M?

Sure. It ties up your computer doing the bit banging. As long as you
aren't using the computer for anything else anyway, that's Ok. Note
that you can build the Baycom interface for about a tenth what you'll
pay for the Tigertronics, so if you're really on a budget, do it that
way.

PacComm has assumed manufacture of Gracilis products. If they don't have any on hand, you're likely to have to wait until they schedule another production run. I don't know of any stocking distributors who might have any on hand. There isn't a high demand for this product and most dealers only stock products which turn over relatively rapidly. This is the reason we chose to use PCs as the switches in our network. There is never a problem with availability.

>C5718 FT2500 (need mods)
>DR610
>
>
>Is there who also realy compare radio's and can say, which radio from
>"9600 Packet Ready" is the best ?

Frankly, *none* of them. All of these radios have BERs which are too high for reasonable performance. And Txd is too long for efficient LAN operation. And they can't be fixed. This isn't a case of "good, better, best". What we have here is "terrible, horrible, and unspeakable".

I wouldn't recomend buying *any* of them for 9600 baud packet use. Stick with radios that work properly, like the TEKK and Azden, and don't waste your money on any of these so-called "9600 baud ready" radios. Note that the FT8500, C5718, and DR610 are pretty good *voice* radios though. The others suffer too much intermod, especially the TM-733.

Note I define satisfactory (arbitrarily but rather generously) as a combination of average throughput at least 4x that achievable with 1200 baud under the same conditions, and causing collisions to other users on a LAN with 20% loading less than 1 packet in 10. None of the listed radios can meet these criteria. The TEKK and Azden can, easily.

The TEKK is so much the cheapest that there is really no thinking required to choose it as best. Even if you have to follow it with a (quick switching) amplifier, you'll still come out ahead. In a well designed network, there should never be a need to switch frequencies, so the fact that it is crystal controlled is not a

drawback. (If the network isn't well designed, fix it.)

Trying to use the same radio for voice and for 9600 baud packet
is not a good idea. You need to leave the packet radio on your
LAN frequency so that the network knows where to reach you when
there is traffic for your station. And conversely, you want your
voice radio monitoring a voice repeater where your friends can
call you. Hopping back and forth is never satisfactory. And sooner
or later you *will* try to send a packet on the voice frequency,
or vice versa, to the annoyance of everyone involved. (We have
one user with a TM451A, truly the worst of the worst, who does
this consistently.)

Several of the diode switched bricks intended to follow HTs switch
fast enough (most of them using relays do too). I use an old surplus
50 watt Motorola brick amp with my TEKK. Works fine. You get faster
keying if you let the TNC PTT drive the amp's external keying line
rather than letting it operate RF sensed, IE wire the radio and amp
keying lines in parallel to the TNC PTT. That's what I do. The amp is
ready by the time the radio is. The RF sense circuit has to rectify
the RF from the radio and charge a capacitor before it will activate
the keying transistor. That usually takes too long.

Hi, Buck. first of all let me congratulate you for your articles written on
CQ JULY 1996 about "Packet Radio". They'
re very easy to understand.
Please, some told me i could find TCM3105 for BAYCOM modems in USA, but
gave me not address...Do you know where i can find them..? Any help will be
highly appreciated....73's de Jos&#65533; (YV4FNC).../

> amp.

Don't use a COR in the amp, wire the amp's relay driver direct to the
TNC and let the TNC key both the radio and amp at the same time. Many
amps have external provsion for exactly this use. Otherwise you simply
need to verify the radio and amp keying circuits are not incompatible.

OTOH, the Mitrek is highly recommened here. Only problem is that 40W
or 50W might be too much. :-)

TEKKs are good too. Worst problem we've had is the tiny 50mV drive level
for TX audio is less than the internal noise floor in our DRSI
DPK-9600's.
Actually *that* problem is the DRSI's. Something is badly wrong when you
have 1.2v noise peaks and 700mV of "grass" on the internal power and
ground. If anyone knows of a solution I'd love to hear of it. Of 2 units
one is only half as bad as the other.

It is more complex to do single conversion from 10m->23cm, filtering
the image is difficult, so why do it that way when a second conversion
stage is simple, cheap, and fairly non-critical?

>>As mode J users know, a 2m->70cm transverter is a bitch because

>link to a higher speed. (e.g. 38k4 4-FSK)
>With QPSK, 57k6 would be possible within the existing raster.

Yeah, though the required SNR is quite a bit higher. Obviously your
bandplan isn't congruent with our modem design, but ours is. We are
allowed to use 100 kHz channels and a top speed of 56 kb in the bands
below 902 MHz, so quite naturally we produced a product to do just that.
Above 902 MHz, we can go faster and use greater bandwidths. Glenn Elmore
has taken that direction with his 250 kbs radios.

Of course our modem still works up there, and its tracking data detector is tolerant of the frequency drift more likely to be found there, and using an intermediate conversion with a transverter for those bands isn't hard or expensive. We can even slow the modem with a dip switch setting to make it fit in a narrower channel. We can just about squeeze into a 50 kHz channel at 38.4 kb. We can comfortably fit 28.8 kb with a generous guardband into 50 kHz. Or more importantly to our needs, we can double the speed to 128 kb up there since we aren't limited to a 100 kHz channel above 902 MHz.

With our terrain and sparse networks, the higher frequencies aren't as useful to us as they may be to you. So the modem was designed to be easiest to setup using the 219, 222, and 440 MHz bands where we can easily exploit longer hops. Thus a 2m IF would be a bad choice, but a 10m IF would be perfect.

>Can any transceiver of UHF make 9600 packet ?? Or do I need a special one
>(I haven't got any yet).

Absolutely. The best value is clearly the TEKK KS900. It works fine and costs very little. It is 2 watts and crystal controlled. If you must have more power, most of the amps intended for HTs will work (key direct, don't use RF sense). If you must have frequency agility, then the Azden PCS9600D also works fine. But it is about 6 times as expensive as the TEKK.

Don't try to time share a radio between voice and data usage. It is never a satisfactory way to operate. Buy a TEKK for data, and buy whatever voice radio you like for voice. You'll be much happier, and you can ignore all the "9600 baud ready" BS from the voice radio manufacturers.

You don't need the cap. There's one built into the TNC.

>
>I have never seen of anyone using a ht for 9600 baud and I would not
>attempt it myself, I am sure it would end up to be a major headache!

The O2AT TR switch time is very long. It is annoying for 1200 baud,
and fatal at 9600 baud. That's due to the "leaky PTT" switching
technique used. Here's a better 1200 baud hookup for "leaky PTT" HTs,
IE Icom and Yaesu.

```
T1
TNC PTT --------))))))------------> HT mic tip
======
TNC AF OUT------))))))----x-------> HT ear sleeve
TNC GND-------------------|
TNC AF IN <------------------------ HT ear tip
```

T1 is any small audio transformer (like the ones that used to
be found in pocket portable transistor radios). Radio Shack
had grab bags of these a while back.

What this circuit does for you is eliminate the resistor for the "leaky PTT". That reduces the switching time constant and makes the radio switch faster (not fast enough for 9600, but better for 1200).

For 9600 baud, of course, you need to connect directly to the discriminator and directly to the modulator in the radio to have a hope of doing 9600 baud. Since the 02AT has PLL loop modulation, it probably still won't work unless you modify it for dual point modulation. It requires major surgery just to hook it up. Using a HT for 9600 baud is pretty much a hopeless cause. If you manage to get it to work at all, it won't work well.

Gary

Hello Mary. I have a newer FT 736. On 6 it should put out 10 watts in the FM mode. If your not getting full pwr out, carefully check all your connections and the SWR. If your SWR is high, the rig automatically "folds" back the output pwr tp protect the rig. I found that by putting an SWR/PWR meter between the rig and my amp the rig would put out full pwr. Another trick is to trim a short piece to until you get a flat SWR and full pwr. Good luck..Oh Yaesu will deny any knowledge of a problem. After much frustration, I got the real story from the designer of "TE" amps, here in sthe So Cal area. 73 Mike K6YPB

Hook it up to the shield of the speaker plug the (3.5 mm plug)

> 2: do I need to put any resistors or capacitors in line with the mic.
> plug?

Yep, place a 3.9k resistor on the ptt line from the tnc and a 0.1 uf
capacitor on the audio line from the tnc. then tie the other legs of
the cap & resistor to the center pin on the 2.5 mm mic plug. You do not
need to use the shield of the mic plug.

> 3: would the mic/speaker plugs need to be stereo or mono plugs?

both plugs are mono speaker is 3.5mm and mic is 2.5mm

This info I gave you is for using the ic02at on 1200 baud packet...
Remember that for 9600 baud you need to connect to the discriminator...

I have never seen of anyone using a ht for 9600 baud and I would not
attempt it myself, I am sure it would end up to be a major headache!

First of all... The chip is expensive.. It's $110.00.. The KPC-3 'REALLY'
doesn't need the 512K chip.. Trust me.. But if you want to try.. You can
find them at Arrow Electronics.. I got mine from the CT office.. I don't have
the phone number or anything.. I am in the process of moving and have
everything packed.. If you need more information.. E-Mail me at
n1obu@worldnet.att.net

Have a Nice Day!

IMHO the value of a TNC is virtually zero. It's an obsolete paradigm.
The value of a 56 kb RF modem compared to a 1200 baud AFSK modem,
however, is considerable (about 48x in fact).

> This is my point exactly, with the margins so thin, the way its being done

>puts and outputs. And let the RF guys do their thing.
>
> The old version of the DSY modem had I/Q signals between the TX encoder and
>the RF board. The problem was that u had to buy the 10 meter RF board. This
>locked the system into the very expensive transverter scheme, economically.
>Since u paid for the 10 meter I/Q transmitter, already.

The IF section adds roughly $50 to the parts cost of the RF modem, but
without it, it wouldn't *be* a RF modem. No one makes a complete compatible
"I/Q radio", and certainly not for $50. Several *do* make transverters we
can use.

I know GRAPES doesn't want to get back into the kit business. But if
you come up with a compatible "I/Q radio" with adequate performance, and
costs under that of a transverter, it *might* be possible that the encoder
and decoder boards could be made available again. I think it is pretty
safe to assume you can't do that, however. We looked hard at it ourselves.

Note, Rick Campbell's R2 T2 are *not* satisfactory I/Q radios for this
purpose (though they are useful for more modest I/Q usage). We *need*
that IF filter in our modem. It won't work correctly without it. We
can't yet economically do the filtering for 56 kb at baseband with a
DSP (we're getting closer, however). When we can do it in DSP, we
won't need the GRAPES encoder or decoder either, we'll just do that
in DSP too. Meanwhile we still need a superhet with a IF filter that
has the proper phase response for our waveform. That's why we chose
to produce a RF modem in the first place, we can't do it at baseband.

> Yes, a coherent demodulator has a longer lock up time, so what. Who said

>operated 100 % duty cycle. Besides closer spacing of these regenerators.

Yes, coherent demodulation would improve performance at the noise
floor by about 6 db, and yes that could conceivably be useful in a
bit regenerated duplex LAN *with continous idle flags*. (It wouldn't
be useful without the bit regeneration and idle flags, of course, since
it would still have to relock to each repeated signal just as it does
on a simplex LAN, and carrier detect can no longer be used for collision
avoidance due to the need for continous idle flags to keep the loop locked.)
I don't think it would be very useful, however, since we don't operate near
the noise floor in practice. That would require automatic power control
(ala cellular), and we don't have that. Nor do we have the density of
users which would require that. A benefit we don't need is no benefit
at all, especially when it has a negative downside for the more typical
simplex usage.

> I agree, at the time it came out, the DSY modem was a heck of a deal. No
>longer. And without improvement in the economics of the implementation, its
>turning into a bad deal, slowly. I m affraid the closest analogy here is that

>disapointed that the re-make, did not consider this. And make the 10 meter
>RF deck, an option I wouldn t have to pay for.

Give us a real, currently shipping, alternative. The I/Q radio you
assume is currently vaporware. Just how many sales do you think we
could make of a product no one could actually put into use?

We've got a W&T product which is (finally) shipping out the door.
You can actually buy it, and you can actually buy the transverter
and data pump you need to make it plug and play. It isn't vaporware,
it is real. A system that works and is available is worth infinitely
more than vaporware.

(Note, I wouldn't be mad, though PacComm certainly would be, if you
could bring to market your dream setup and grossly undercut the price
of our RF modem. I frankly don't think you can. I know we looked at
that option and decided we couldn't. If we could buy the custom RF
chips and hybrids needed in quantity 100,000, we might have been able
to do it, but even the most wildly optimistic of our group understood
we aren't going to do that sort of sales volume. Digital cellular and
wireless LAN manufacturers can gamble on that sort of volume, but we
can't.)

You can probably do up to 4800 baud if you use a HAPN modem. 9600
baud probably won't work without radio modifications, and you can't
legally do that under your CB rules.

Hi everyone. I am looking for a good terminal program for Windows.
Right now, I'm just using the TERMINAL program that comes with Windows,
and I'd like to have a real packet terminal. I am using a AEA PK-88.
I'd prefer shareware so I can take a look at it right away. Thanks.

Source record: 34669

Hi All,

A friend and I have playing around with 9600bd fullduplex packet links using NOS under linux. I am wondering what parameters others are using at 9600bd. i.e MTU MSS TCP Window paclen...
We have a fairly reliable path (99%).

One of the things we have done is to increase the ax paclen to 1024, MTU to 1004, MSS to 984 and tcp window to 1968. However for some reason it won't use a tcp frame with more than 512octets of data. Does anyone know the reason. We are both using standard TNC-2 clones (and yes they were crashing reliably before we increased paclen beyond 256. Looks like we need the 10MHz mod...)

We still have alot of fiddling to do with TXDelays at both ends.

I am also interested in what sort of results other people get out of dedicated 9600bd full/half duplex links.

Andrew VK6JBL

(the best ftp transfer rate we have got so far is 307Bps which isn't bad since we have only spent a couple of hours playing.)

Hello, Folks:

I have just put up my new home page and invite all to drop in for a look. Included at the site are the following areas:

Ham Radio -- Mostly packet, mostly high speed

Pipe Smokers -- Very, very much still under construction

Astronomy -- Mostly Amateur Radio Astronomy (good 2nd interest for Hams!)

Mapping -- Mostly about elevation maps

Heartland Internet Services -- Lots of Web Presence information

The URL to use is:

http://www.trucom.com/ppages/marty

Thanks!

Take Care & 73

Message-ID: <01bb9d7a$3547f5e0$53066fcf@wkarl>
Source record: 34673

I recently downloaded a new version of Winpack by G4IDE. This is a very clean and elegant program for controlling AEA and Kantronics TNCs in the Windows environment. For those of you used to host mode programs it may take a little getting used to since it operates in command mode. It is primarily designed for the British packet scene but works well in the States, too. It can run all modes. Anything your TNC can do it can do.In addition to all this it is FREEWARE. You are looking for winp540.zip. I downloaded it from:
http://oak.oakland.edu:8080/pub/hamradio/dos-utils/
There are other sites available which are listed at the FTP section of the ARRL Homepage:
http://p1k.arrl.org
I'm sure you will have some fun with this program and you can't beat the price - thanks to Roger, G4IDE. Even the upgrades are free.
Bill, W2BY <wkarl@magnum.wpe.com>

Hi there, I am also interested in what value some parameters should
have for optimal throughput..... I am not currently running NOS, but I
have some thought on start using it. Now I run FBB at 9600 baud with
DED-hostmode towards SM7UGO BBS with FBB and BPQ v4.08a, and we have
somewhere around 400-600 bytes / second on our simplex-frequency.

Also, could someone tell me how the forward-scripts works with JNOS.
If a FBB BBS forwards bulletins to my JNOS, how do I put up a
fwd-script to forward ALL these bulletins to another FBB BBS ? I have
had no luck when I tried...

Couldn't see an email address,callsign etc. so I'm unsure whether
you're in USA or Europe!!
In Europe,most ATV is on 24Cms & 10GHz bands using FM Video
modulation,almost the same as used by analogue satellite receivers.
Indeed,most people's receive setup uses TVRO parts.
IN USA,they're "behind the times" in that most ATV uses AM Video
(often on 70Cms band which uses a lot of the available bandwidth).
I know that HRO (Ham Radio Outlet) in USA lists some ATV gear.
There's also an outfit called "ATVQ" who were at Dayton hamfest
when I attended 3 years ago.They had European & USA books on
ATV.
There must also be a national organisation for ATV in the USA.
OTOH,if you're in Europe,give an idea of location or callsign &
I'll respond with where to get info & equipment in Europe.

Chris Muriel,Manchester,England (G3ZDM)

Hi Jon,
Buy either a Garmin 45 or a Garmin 45XL (the same as the 45, but
with a few more bells and whistles). I got my 45 for $280 and have had
no problems with it! I love it! I have ehard good things from people
who do have them, and from people who do NOT have them.
Search the web for more info by using "Garmin" in a search engine.

That's true. The Commission is charged to allocate spectrum in much
the same way as Zoning boards are charged to zone property. They are
to give precedence to the "highest and best use".

>>We need to shift our paradigm away from the telco model of high

Please do. It is the central concept which needs to be understood.
We don't have the resources to install high speed GEO relays, so

we are constrained by physics to HF, and that simply won't support
a number of T3s.

>>seen by some as a handicap, but it isn't really. Traffic analysis

>
>Same response as previous paragraph ...

Even the telcos understand this. It is tempting to speak of the
"global village", with someone halfway around the world being as
close as your next door neighbor. But the reality is that you
have more frequent interactions with your neighbors than with
those more distant. That's generally because you have more in
common with people in your area than with people further away
who you probably don't even know exist.

The internet is in some ways a contradiction of that. The flat
rates tend to allow communities to form who are geographically
dispersed. But still, if you want to play Doom, it's more likely
you'll do it on your local ethernet than with someone on the
internet on another continent. Even relatively fast trunks have
limits, especially when they are shared by the whole world.

>>Much of our current amateur radio long distance traffic is highly

>>interactive connection for the user).
>>
>
>The average CW proponent is probably wondering "What the hell does
>*coffee* have to do with the code?" ... :-)

Tsk, tsk. Just because they like CW doesn't mean they don't know
about other things. In particular, the ARRL numbered radiogram
idea was originally a construct of the CW relay networks of its
era, so the idea of dictionary data compression isn't foreign
to the CW operator. He might not have thought about it as a
powerful compression method before, however.

>>As long as we can forego highly novel content rich exchanges, we
>>can utilize HF trunks with 8x less throughput than our local loops
>>without creating significant bottlenecks.
>
>But must we sacrifice content? I don't think so ...

Highly novel rich content, yes. We don't have the bandwidth to
do otherwise over long distances. Even if we used *all* of our
HF allocations strictly for data, and used the best currently
known techniques, we'd only have the equivalent of 6 T1s *for
the world*. Those T1s wouldn't be exclusively for our own use,
they'd be shared with every other amateur on the planet. And
of course because of propagation, we could only use a fraction
of that capacity at any given time. So if every amateur decided
to web browse at the same time, each would have a throughput
of about 1 bps. It's not really that bleak. Propagation helps
as well as hinders. We can practice quite a bit of frequency
reuse because of propagation. But *we* don't dictate to the
ionosphere, it dictates to us, so any extra throughput we
get may not be to places we want to go at any particular
time. So we need to be parsimonious with the resource that
we have.

>This, of course, applies to "current" 1200/9600 baud AFSK packeet
>"technology", but I don't beleive that it has to apply to *all*
>techniques that could be applied above HF ...

It applies to any packet switched technology. Each switch must
wait until it receives an entire packet to determine if it is
valid, and to determine where to forward it on. Then it must
transmit that packet. It takes just as long to retransmit it
as it took to receive it, so effective channel baud for that
message is halved with each relay. This is the reason multiple
hops introduce latency. On a 6 hop path, the effective baud for
that message is 2^6 less than the basic baud used between
switches. In other words, a 9600 baud channel effectively has
the round trip delay of a 150 baud channel if it has to go
through 6 hops.

Of course if the traffic isn't interactive, and has a *huge*
sliding window at the end to end transport level, we can
pipeline. The latency is still there, but because we can
keep the pipe full, the amount of data sent remains consistent
with a 9600 baud channel. That's useful for bulk mail, but
isn't much good for interactive things like web browsing or
interactive games.

>>By using improved signal modulation codings and demodulation
>>techniques, we can achieve 9600 baud on HF without excessive
>>bandwidth consumption.
>
>This is correct, but to an extent panders to the idea that using more
>bandwidth is inherently "bad" and inefficient ... which I know *you*
>know is not true ...

Well, we have finite bandwidth. We can use it in a number of ways.
SS uses it one way, narrowband technique uses it another, but the
available bandwidth is still finite, and the amount we use of it
still remains the same whether we take it in thousands of little
slices or all in one lump. There are advantages and disadvantages
to either approach. (For disorganized amateur radio, SS has more
advantages than deficits.)

Cross-posted to: sbay.hams,rec.radio.amateur.digital.misc

I've heard that the N0ARY PBBS and Internet gateway is now
being run by some committee instead of Bob himself. (He
certainly deserves a break after all his hard work!)

Does anyone know how I can contact the sysops? I need to have my
gateway information changed ASAP. (They aren't fields that I can
change myself.) The machine they're currently forwarding packet
messages to and accepting mail from is going away in a couple of
weeks. I've tried every "HELP" and "INFO" query I could think
of on the PBBS itself, with no luck finding whom to contact for
administrative requests.

Thanks/73,

Patty

The full spec's for the FT-736 can be found at;

http://www.yaesu.com/736spec.html

It seems Yaesu has changed the spec to state input power, not output power anymore. When I was looking at it a few years back all bands were 25W out except 1.2Ghz, which was 10W. Now you don't know what you'll get. Way too expensive for me and not know what you're getting!

4894. RCS 2200 - Camus mode compatible radios - where to get them?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-09-09 00:00:00 UTC
From: ljubisic@EUnet.yu
Message-ID: <5127dd$b36@Solair3.EUnet.yu>
Source record: 34551

Hi!

I am having a little problem. I have to expand our company's radio system, and I have to purchase radios with DTMF keypad (we have also radio-phone system), but they have to be RCS 2200 - Camus mode compliant. We are using Motorola MX3000 (Stornophone7000) devices at the moment, but due to it's price and quantity we would like to buy, we are seeking for some cheaper solution. (By the way, I heard something about some new software for MX3000. Anybody has it? What are new features, if any?)

So, I was told that Alinco's DJ-130 model is Camus compatible, but local dealer couldn't confirm it. Also, I heard that DJ-182 with its Al-trunk logic board (which operates with CTCSS) could be MODIEFIED to be Camus mode compatible. Is there anybody from Alinco who could tell me if this is possible, and how?

Also, one friend told me that ICOM-H16T (#17), with Logic-A-Unit (EP701, PCB B1580H) is Camus mode compatible, and he wasn't sure, but also told me that ICOM IC-F30LT with UT-96 5 tone unit is also Camus capable. But, same thing as with Alinco, local delares couldn't confirm or deny it. Anybody knows it? Is there any e-mail contact in Icom where I could check it?

And finaly, it doesn't have to be Alinco or Icom, it could be also Yaesu, Kenwood, Standard, Harris... but I have to know is it Camus mode compatible, and how to order such option or modification from manufactorer/dealer.

If anybody knows something about it, I would like to ask him to send me a note _by mail_, since I wouldn't like to miss such importnat message by skiping it somehow in newsgroup.

Thanx for understanding!

4895. Any news on SPLOG ??

GLONASS is just a shade more accurate then the military version of
GPS, about 10 meters, which I don't think is accurate enought to land
airplanes with anyway. Leastwise I wouldn't want my pilot to land the

plane 30 feet above the ground!

Here is a way to quickly, easily generate large streams of cash in relatively little time with very little investment. It's worked for others and unlike most get-rich-quick schemes, it will work for you. Does a $7,000 return on a $7 investment sound like a worthwhile opportunity? $17,000? $27,000? If you could use that type of money, and you can spare seven bucks - five $1 bills, envelopes and postage - read on. I know you're skeptical, and so was I at first, but I ask you to please read on and get all the facts before you write off this incredible, legal business opportunity. Someone else wrote the instructions below, but they did such a good job I figured "why mess around with them?" They might seem long-winded, but please bear with them - you *will* thank yourself later... if you're paying an hourly connection fee, it probably doesn't matter since you'll soon be swimming in cash anyway. But if it's really a concern, download this article to your computer or print it out and read it offline. You will NOT be sorry! Here are the instructions:

****
*

!!!HONESTY IS WHAT MAKES THIS PLAN WORK!!!

****
*
I wrote a small note to send with the dollar saying "please add my name to your list." I then took the first name on the list off and moved the
rest of the names up one slot. Then I added my name in the number 5 slot of the list (The placing your name on the list is where you make money). I then took the new list of names, which now included my own, and E-Mailed it to every BBS operator in Fidonet, which is a group of BBS operators across the world. I figured that was a good way to get it to a lot of people fast. I then sat and waited for the money to come in. I was expecting to maybe make, at the most $500 to $600 dollars, or at least somewhere in that area.

The secret from my wife was out after about 2 to 3 weeks. It became very hard to keep the secret any longer from her, because of the return addresses. She was wanting to know who, what and why there people from all over the world where sending me a dollar bill. I then explained it to her and she could not believe it. The mail continued to come in every day. My mail carrier even questioned me once or twice. it was a feeling beyond belief. I guess that you want to know how much I made now? Well, I did not reach $35,000, but I did bring

in $14,684. I just could not believe that it worked this well.

The first thing I did was pay off mine and my wife's car. It felt so good calling the bank and asking for a payoff. I then took the rest of the money and paid off as many of my credit cards as I could. Now after 1 year, I am ready to do it again. This time my spouse suggested USEGROUPS on the Internet, and I believe that it should work better than before. I think that someone could hit that $35,000 mark, but I do not know that yet. It all really depends on you, the individual. You have to follow through and re-post this message everywhere you can put it. the more people you get it to the better the response you will get. It is just too easy to pass up this money making system!

I will say this much about this system, it works! I got hold of this list after it had already been all over my home town. I have talked with everyone of the below list, and they said that they started out thinking that it would not work. Most of them made more than I did on the first go around. I am not yet really sure who started this thing or really where, but THANKS!"

!!A LOOK AT THE REASONS YOU NEED TO DO THIS!!

Let's look at the reasons you need to do this. First of all it only costs less than $7 - 5 $1 bills, 5 $0.32 stamps, and 5 envelopes that you need to mail to the 5 names on the list. Then simply re-post the message and list, with your name on it, to all the USEGROUPS and public BBS's you can. Then just sit back, relax, and enjoy receiving mail in your mailbox - mail with dollar bills in every envelope! Everybody has $5 dollars to put in something that will make them $10,000 to $15,000 dollars in about 3-6 weeks. Ask yourself this simple question, "Where can I get $5?" Take lunch to work one day, drink water instead of pop or tea five times, hold off on those lottery tickets, and put $5 dollars in this MONEY MAKING SYSTEM NOW! It is really hard to lose.

Follow these instructions step-by-step if you are ready to make some money. You might want to make a printout of these steps to make them easier to follow.

1. On a blank piece of paper write the following message:

"Please add my name to your list".
** YOUR NAME AND ADDRESS **

You will be paying for a legitimate service and making this money system completely legal. You will not be just sending a dollar to someone, but paying for the legitimate service of adding your name to their list. Make sure to also write down your name and address on this piece of paper. I assure you once again that this is completely legal!

2. Fold your piece of paper around the dollar bill, (NO CHECKS OR MONEY ORDERS), and put both in the envelope. Address an envelope to all 5 of the people on the list. You will find that list at the end of this message.

3. Now, here is where you make your money. Look at your list of 5 people. Remove the name in slot number 1, and move all the other names up 1 slot. For instance, move the name in slot number 2 up to slot number 1. The name in slot number 3 then moves up to slot number 2. The name in slot number 4 should then be moved up to slot number 3, then finally the name in slot number 5 up to slot number 4. Then put you name and complete mailing address in slot number 5.

4. Now, upload this updated file, with your name in slot number 5, to as many USEGROUPS and BBS conference areas and file areas as you can. Remember the more people that get the message to the better the response will be for you, and the other people on the list. Give the message a real eye catching name so it will catch someone's eye. Some examples are: "Need some extra money?", "Need some money quick?", "A way to pay off your bills fast!!!", or "Money!". Set a goal on how much money you want to make and keep these numbers in mind at all times. With this goal in mind, you will get a good figure of how many people must read the message and then respond. You can make it easier for people to receive your message in USEGROUPS by UUE encoding the file when you are uploading it. That way people can download it to their hard drive or a floppy. Don't alter the file type, leave it as a MS-DOS Text file. The best way to test the file is to open the file using Notepad in windows to make sure the margins look right. You should make sure that the viewing person does not have to slide the screens back and forth to read the message. One other thing about the list of names, you should not try any funny editing of the list of names.
You should add only your name and no others to the list. If you want a friend to do it with you give them a copy of your edited list, with your name on it, so you can make a dollar for yourself.

5. If you need help uploading your file, ask someone on the system you are trying to upload to. Somebody will always help you with the matter. When you upload it as a file on a BBS by sure to give the file an eye catching name like: "CASH.TXT", or "MONEY.TXT".

6. After you do all the above steps sit back and wait for the money to come in. Expect to see some money start in about 2 weeks. When week 3-4 rolls around, the money will really start coming. It is more than just a normal feeling to see all the money that you will receive.

7. Now you pay off all your debts, and then go and buy something that you have always wanted or maybe something that you have always wanted to get someone else. After that, just enjoy life!

8. When you have spent all of that money, simply start posting the same message again. Post it in the old places, and maybe some new

places. Don't just delete this file after the first time, because you
can reuse it time and time again in the same
way you did the first time.

The list of names are below.

****

I'm looking to buy (new or used) a pocket packet TNC. Does anyone have one
forsale or know where I could get one?

Thanks

>After much frustration, I got the real story from the designer of "TE"
>amps, here in sthe So Cal area. 73 Mike K6YPB

Of course Yaesu will deny there's a problem. That's because there
isn't a problem with the radio. It is performing exactly as intended,
and exactly as any other competently designed radio would perform
when offered a grossly bad load.

The problem is in the amplifier. It is not presenting a good load
to the radio. If the amplifier designer were competent, there would
be a 50 ohm impedance presented by the amplifier to the radio.
Unfortunately, that doesn't appear to be the case with some
amateur amplifiers. (The input "networks" are often a bad joke.)

Using a length of 50 ohm cable as a transmission line transformer
can transform the impedance presented by the amplifier to some other
value, but it can't transform it to 50 ohms. So you can't present a
perfect load to the radio this way. You sometimes can get it "good
enough", however, since the radio doesn't start to fold back power
until the presented impedance is outside the range of 25-100 ohms.

Note that the impedance may be complex, and depending on the reactive
part of the impedance, the range over which you can deliver a "good
enough" load impedance may be smaller than the range that would apply
for a purely resistive termination.

You *can* use a transmission line transformer to transform some
presented impedance to 50 ohms, but the transmission line's
characteristic impedance has to be something other than 50 ohms,

IE 75 ohm quarterwave lines are conventionally used to transform
a 100 ohm impedance to a 50 ohm impedance for example. You can
easily figure this out using the Smith Chart.

The better course is to fix the problem with the amplifier's input
network so that it actually presents a 50 ohm load to the radio.
Then the length of the transmission line between radio and amp
won't matter (a transmission line won't act as a transformer if
there is 1:1 VSWR on it).

Now Alan doesn't say he's using an amplifier, so if he's seeing
foldback, it is because the antenna he is using isn't presenting
a good load impedance. Again, the correct solution is to fix the
problem, which in this case is at the antenna. The antenna may
be reactive because it isn't resonant on 6m. Or if it is a groundplane,
it'll have a 36 ohm base impedance anyway, unless the radials are
drooped to about a 45 degree angle below horizontal, which will
raise the base impedance up near 50 ohms. Etc. He may even have
a bad piece of coax, or an improperly installed coax connector,
causing a bad load to be presented to the radio.

Note, if he is seeing this power reduction into a known good
dummy load fed with a known good cable, then there really is a
problem in his radio.

Gary

4902. RCS 2000 - Camus mode compatible radios - where to get them?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-09-09 00:00:00 UTC
From: ljubisic@EUnet.yu
Message-ID: <511jrm$5gs@Solair3.EUnet.yu>
Source record: 34694

Hi!

I am having a little problem. I have to expand our company's radio system, and I have to purchase radios with DTMF keypad (we have also radio-phone system), but they have to be RCS 2000 - Camus mode compliant. We are using Motorola MX3000 (Stornophone7000) devices at the moment, but due to it's price and quantity we would like to buy, we are seeking for some cheaper solution. (By the way, I heard something about some new software for MX3000. Anybody has it? What are new features, if any?)

So, I was told that Alinco's DJ-130 model is Camus compatible, but local dealer couldn't confirm it. Also, I heard that DJ-182 with its Al-trunk logic board (which operates with CTCSS) could be MODIEFIED to be Camus mode compatible. Is there anybody from Alinco who could tell me if this is possible, and how?

Also, one friend told me that ICOM-H16T (#17), with Logic-A-Unit (EP701, PCB B1580H) is Camus mode compatible, and he wasn't sure, but also told me that ICOM IC-F30LT with UT-96 5 tone unit is also Camus capable. But, same thing as with Alinco, local delares couldn't confirm or deny it. Anybody knows it? Is there any e-mail contact in Icom where I could check it?

And finaly, it doesn't have to be Alinco or Icom, it could be also Yaesu, Kenwood, Standard, Harris... but I have to know is it Camus mode compatible, and how to order such option or modification from manufactorer/dealer.

If anybody knows something about it, I would like to ask him to send me a note _by mail_, since I wouldn't like to miss such importnat message by skiping it somehow in newsgroup.
Thanx for understanding!

In article <kriss-3008561845350001@lanrover1.spec.com> kriss@spec.com (R.M. (Dick) Kriss) writes:
>Sorry, I can't think of one reason; however, the network people
>here feel it better than NOS, JNOS or TNOS. Can someone provide
>ten 'good' reasons to change?

The first 10 reasons I can think of off the top of my head are
that it is a real operating system. :-)

It is a true premptive multitasking multiuser operating system with
kernel support for TCP/IP and AX25 built in. It treats AX25 as just
another link level driver, like its ethernet driver or its ppp driver.
And it offers full TCP/IP routing, including DNS, and recent releases
have a nice windowed administration system for configuring the network
and router. Any TCP/IP sockets aware application can use the operating
system services to send and receive packets, and any number of such
applications can do so at the same time (up to the limits of the virtual
memory swap space anyway).

Thus you can treat a user doing a login over packet exactly the
same as a user doing so on the local ethernet. You can provide
as many applications for the user as you desire to offer, and
they can be the *same* applications you'd offer over the local
ethernet, IE virtually everything on the machine. Several users
can do this at the same time. If more than one user tries to use
the same application at the same time, the OS will spawn a separate
copy of the application for him.

In other words, it's a real operating system, not a program loader
like DOS or an unstable GUI like Windoze. Linux includes the full
client/server X Window system so remote users can run graphic
applications just as if they were on the local console, though
slower of course. It's also *free* (except for the downloading
time, or CDROM media cost, or mag tape media cost), and comes
with complete source code. Current releases have drivers for
Ottawa PI2 cards as well as drivers for serial port connected
KISS TNCs, and there's even a Baycom driver available. You can
have all of these running at the same time of course (it's a
real operating system).

You can become a usenet host, using C news or INN, and let your
users read and post news via packet (though I'd use a daemon
to watch the traffic to keep it legal for amateur radio). You
can publish web pages accessable via packet, offer browser
service, etc, just like the big ISPs (who often are running
Linux themselves).

And Linux is very efficient. It will fly on hardware where
Windoze would barely run at all. Of course it'll use any
extra horsepower you give it, but you can have a workable
system with only 4 Meg of memory and 80 Meg of hard disk
with a 386SX-25 processor. Win95 wouldn't even load in that,
but Linux would be quite productive in that limited
environment. Put it on a hot Pentium (or a DEC Alpha)
with scads of memory and big hard disks and you'll think
you have a mainframe, in fact it is being used to replace
mainframes in some applications.

It'll run most DOS programs under an emulator (CP/M programs
too), but it doesn't yet run most Windoze programs. If you use
a lot of those, then you'll have to keep a Windoze machine around
(or set up LILO for dual boot). And of course it runs all of the
thousands and thousands of free unix programs available via the net
and elsewhere.

Of course it is essentially Unix, and as the unix gurus say,
there are places where "you just gotta know" to make it all
play. Extensive documentation is available online (well over
1,000 pages), so everything you need to know is there, if you
can find it and understand what it means (or you can always
just look at the source code). This isn't a system you'll just
load and be up and running over a weekend, unless you have prior
Unix administration experience. Expect to take a month of spare
time to come up to speed on the system. But then you too will be
a unix guru who can say, "my other login is *root*", and will be
entitled to look down your nose at mere program loaders and unstable
GUIs as the inferior toys that they are. :-)

Fair warning, it is very easy to get so excited about Linux that
you'll spend all your time exploring and playing with it and
forget to get on the radio. Like websurfing, it is addictive.

>Thanks guys!

Hi Don.

Here is a file I downloaded (I forget where) that allows you to make 512k
of memory in the KPC-3 and/or the 9612, with 256k chips.

For you net-police out there, I have NOT tried this, and the authors call
is included at the bottom.

[start]

KPC-3/9612 512K upgrade
Kantronics KPC-3/9612 512k upgrade.
It is possible to expand the KPC-3/9612 memory quite easily with a 128K chip.
Simply plug in the chip and you can get five nodes and a 101000 byte
mailbox. According to the the Kantronics KPC-3/9612 manual, the unit is
expandable to 512K. Unfortunately, no 512K static RAM is currently being
manufactured at prices easily affordable.

By simply using the two extra address lines Kantronics has built into the
KPC-3/9612 along with a few 128K chips and a decoder it is possible to build
512K into the TNC giving five nodes and a huge 491000 byte mailbox!
Kantronics has made available two extra address lines which will be used by
the new expanded RAM. These are used, along with a 74HC139 decoder IC and
four 128K static RAMs to build all 512K into the TNC. Using this
combination will allow five nodes, and a huge 491000 byte mailbox! I used
four KM681000ALP-8 128K static RAMs. If you use a different type, plug in
a single RAM IC to verify it will work.

When inactive, the data lines of the memory ICs are in a high impedance
state. They are neither logic 1 nor logic 0. Address lines are high
impedance inputs. All remaining pins are either for power or left unused.
Except for the individual chip enable lines, all lines may be bridged.
Only when selected will the data lines be active for reading or writing
information.

The 74HC139 is a 2 to 4 line decoder. I am using the original enable line
of U9 at pin 22 to control its output. The extra two address lines select

which of the four output lines will be active when the memory is addressed. The 74HC139 will drive one of the four memory ICs.
Begin by placing all four memory ICs in a stack. Solder all common pins of the four ICs except pin 22. Use needle nose pliers to bend each pin 22 at right angles to its existing position so the four pins stick out to the side of the stack. The socket for U9 must be removed to allow the cover to fit when the four ICs are installed. Carefully desolder it and clean all the pin holes. Solder the four ICs into the space used by U9, observing the correct position.

Place the 74HC139 on the side of the memory stack with the pins sticking out. I glued it upside down to the top of the microprocessor, U4. Apply +5V to pins 13, 14, 15, and 16. 5V is available at pin 32 of U9. Connect pin 8 to ground at pin 16 of U9. Address line A17 connects to pin 2 of the 74HC139. It is available at J6, pad 2. This is the closest pad to U9, next to Q1. Desolder the pad and place the wire through the board. Do not change the trace at J6 between the center pad and position 1. Address line A18 comes from pin 1 of U9. It is available at a hole through the board on the other side of Q1 from J6. Follow the trace on top of the board from pin 1 and you will see it. Desolder the hole and put a wire through. Connect it to pin 3 of the 74HC139. Place a wire from the empty hole for pin 22 of U9 to pin 1 of the 74HC139. Finally, connect pins 4, 5, 6, and 7 to each of the four pins of the memory stack. Refer to Figure 1 for details of wiring the 74HC139.

When everything is wired up, put the jumper across J7 and perform a hard reset. With the terminal set to 1200 baud, the TNC will report 512K available memory! Remove the jumper and reprogram all the parameters. Even with CD SOFTWARE and LEDS ON current in my KPC3 is still less than 15mA.

As an extra note, this technique can be used to increase the memory in the KAM Plus as well. There will have to be minor changes made to the connection points to suit the particular TNC, but the overall method remains the same.

Send a message via packet to VO1KS @ VE1BBS.NS.CAN.NA if you have further questions or comments.

Hello All,

I am looking for a computer controlled receiver.
Preferably with a frequency range of 300-500MHz, it must have an IF
bandwidth of at least 1MHz.

If your company makes receivers of this nature, please email me with
specification details and possibly a web address for viewing your
product(s).

Thankyou.

Hi Tony WA1MWN,
this is Takeshi JN1RII in Japan.
Though it isn't located around New England area , I know one of the most
useful gateways I've ever used.
It's a "ZS5S's Internet<->Packet Radio gateway" , located in Africa.
I'd always send mails from my Internet to a Ham's Packet who lives at
Lakewood Washington the US via the gate , it only takes about 2 days
half to be delivered his reply back at my Internet , without any
trouble.
Of course it's a free of charge.
The following is ZS5S's instruction.
Have fun.
--- Begin quoted material ---
How to Use the ZS5S
Radio <-> Internet Mail Gateway (version 5b)

First, some brief operational notes:

(1) Messages must not contain any foul language or be for
commercial purposes.
(2) Message length should not exceed 5 kB, 1.5 kB if it has
to be transferred via another MBO.
No files should be send.
(3) If you have any questions, please do not hesitate to
contact me either via
Radio: ZS5S@ZS5S.ZAF.AF -or- e-mail: zs5s@iafrica.com

-------
From Radio to Internet
-------

Send as Personal Mail (never a bulletin) to the
Radio address of:
GATE @ ZS5S.ZAF.AF
Subject: Relay
The first line of TEXT must contain a full domained
Internet address, preceded with the word "Internet: "
The second line of TEXT will be the Subject of your
e-mail message.

For example:

SP GATE @ ZS5S.ZAF.AF < radio address
Subj. (Title): Relay
Msg:
```

Internet: john.doe@aol.com < e-mail address
Good News! < subject of your e-mail
Hello John, etc ... < body of the message ended by /ex
or ctrl-z on a new line

From Internet to Radio

Send your e-mail

TO: zs5s@iafrica.com
SUBJ: Relay

The first line of TEXT must contain the full Radio address,
preceded with the word "Radio: "
The second line of TEXT will be the Subject of your message.

For example:

Radio: ZS6XYZ @ ZS6AI.TVL.ZAF.AF < radio forwarding address
Good News < subject of radio message
Hallo Tom, Dick and Harry, < body of your text

Some final notes:
1) In the direction Radio > Internet the Gateway is automated.
Messages entered incorrectly can not be processed and will
be lost.
2) If your BBS or MBO rejects GATE or makes a bulletin of
your message (please check) enter your radio message as
SP ZU1AAA @ ZS5S.ZAF.AF
3) The second line of text, the Subject line, MUST be completed.
Make it short and meaningful.
4) Send a copy of the relevant part of this bulletin to the
recipient of your message.

Have fun and use the Gateway as much as you like. That is what
it is there for.

Joost, ZS5S, sysop
--- End quoted material ---

Best regards Takeshi Tsunemoto

Allan,

I also have a 1988 PK-232 which I first upgraded to an MBX in 1991 and this year I bought the latest upgrade which includes PACTOR and GPS functions.

It should cost you about $ US 75+tax.

Hope this helps,

Gilbert VE6GES.

The question is, how efficiently is it using the channel? If you have to run a TXDelay parameter of more than 50mS (which should be the absolute maximum considered usable for 9k6) then you're spending more time sending sync flags and rubbish than actual data!

Any radio not capable of operating on a channel running a TXD of 10-20mS is *not* 9600 ready, regardless of what the manufacturer, retailer or friendly ham down the road says.

Quite separate from the TX problem is the question of how long does the receiver take to lock onto an incoming signal...I guarantee that if somebody transmitted a 9600bd data packet to you with a 10mS TXD it would be gone before your RX even knew it was there. Get a whole group of people on a channel with radios capable of that and get them talking and then put *one* user on the channel with a slow radio and *nobody* will get any useable throughput from that point on! Why? Because the slow radio won't hear any of the other traffic and will continually transmit retries over the top.

To reiterate, any radio not capable of running between 10 and 50mS TXdelay (or coping with others doing so) is *not* suitable for or capable of efficient 9600bd packet operation.

Regards,
Rod.

>Sorry, I can't think of one reason; however, the network people
>here feel it better than NOS, JNOS or TNOS. Can someone provide
>ten 'good' reasons to change?

If you're talking about PBBS use, as of right now one overriding reason is stability. TNOS/Linux BBS systems commonly stay up for 20-30 days or more between reboots. Our machine, N8ACV, does it frequently. Before we switched to TNOS/Linux, with our JNOS or TNOS based systems 10 days uptime was cause for celebration.

Another reason, but related to the first, is that a TNOS/Linux system can have <everything> turned on in the compile -- you get away from the memory constraints of DOS and don't need to mercilessly prune the config.h file to delete things.

Now, Phil KA9Q just released a version of his code for DOS that uses an extended memory manager and can get around the memory problems. That may go a long way toward solving these two problems, but at the moment neither TNOS nor JNOS have incorporated that (but the next release of TNOS will!).

If you're not interested in purely PBBS issues, Linux now supports AX.25 networking with kernel drivers. That means you can make any Unix TCP/IP application directly available to the network, without running a NOS front end (it also includes pure AX.25 and netrom capabilities, too, so you could even build your own PBBS package using shell scripts, or perl, or whatever, and let the kernel take care of all the protocol issues for you).

I've just started playing with this code, and it is really neat. We're planning to replace our current JNOS switch system with a Linux box. Advantages? Better stability, the ability to dial in to the system by phone, or via a private packet link (it's remotely located) and have full access to the console, and easy interfacing to other network devices.

Oh, and in any of these scenarios, having the underlying Linux TCP/IP networking available opens interesting doors. For example, our PBBS machine is configured to export its filesystem using NFS (a Unix drive-sharing protocol). I can access the PBBS machine (which lives at someone else's house) over our 19.2kb packet link, mount its disk drive as if it were local to my system, and edit configuration files or do whatever maintenance I want as if I were working directly on it. That's a pretty slick capability.

These aren't ten reasons, but they were enough to get us to change our TCP/IP systems from DOS-based to Linux-based.

73,
John AG9V

<gary@ke4zv.atl.ga.us> writes

[some very enthusiastic stuff about Linux snipped]

I have a few questions about Linux. I know there are newsgroups for
Linux, but, since my questions are related to its use in ham radio,
perhaps Gary or someone else could answer them in here?

1. If I install Linux, what release level of Linux should I be looking
for?

2. If I buy a Linux CD (in the UK they seem to cost *more* than Win95!),
presumably I'm going to have to look elsewhere to find the bits specific
to ham radio, such as the AX25 drivers? What's a good starting point?

3. I have one PC on which I could install Linux to "have a play",
because that PC doesn't do much at the moment. All it does is run my
node. It is a DX2 with 8Mb running DOS and BPQ, with 4 radios using BPQ
in polled mode, and an ethernet port. All my other packet equipment
connects to the outside world via ethernet and that PC. Would it be
fairly easy/possible/impossible to set up a Linux system so that PC
could functionally carry on doing what it is doing at the moment?

1996 ARRL and TAPR Digital Communications Conference
September 20-22, 1996
Seattle, Washington (minutes from SeaTac airport)

Web: http://www.tapr.org

The 1996 ARRL and TAPR Digital Communications Conference will be held on September 20-22, 1996 in Seattle, Washington. This year's conference location is just minutes away from the SeaTac (Seattle/Tacoma) Airport.

Not only is the Digital Communications Conference technically stimulating, it is a weekend of fun for all who have more than a casual interest in any of the ham digital communications modes. This includes BBS operators, networkers, DX-Cluster Sysops, software writers, modem designers, and digital satellite communications enthusiasts. The ARRL and TAPR Digital Communications Conference is for all levels of digital operators -- a must conference to attend to get active on a national level. Now, more than ever, amateur radio needs this great meeting of the minds, since it is important that we demonstrate a continued need for the frequency allocations we now have by pushing forward and documenting our achievements. The ARRL and TAPR Digital Communications Conference is one of the few ways to record our accomplishments and challenge each other to do more.

A Conference for the Beginner as well

The conference is not just for the digital expert. This year's conference will again provide an entire morning with beginning and intermediate presentations on selected topics in digital communications. Some of the topics will include: APRS, Satellite Communications, TCP/IP, Digital Radio, Spread Spectrum and other introductory topics. Come to the conference and hear these topics presented by the experts! Don't miss this opportunity to listen and talk to others in this area.

Workshops

In addition to the presentation of papers on Friday and Saturday, three workshops will be held during the conference. On Friday, Keith Sproul, WU2Z, will hold a workshop on APRS packet-location software. Keith is the Chair of the TAPR APRS Special Interest Group, developer of the Macintosh and more recent co-developer of the Windows95 version of APRS, and a leader in the area of APRS technology. This is a unique opportunity to gain insight into

this fast growing new digital aspect of amateur operations that combines computers, packet radio, and GPS (Global Positioning Satellites). On Sunday, Dewayne Hendricks, WA8DZP , will conduct a workshop focusing on "How to utilize Part 15 wireless Radios for Ham Applications." Dewayne is an expert in the area of commercial wireless systems; his company WarpSpeed Imagineering, focuses on wireless Internet connectivity. This workshop presents an opportunity to learn how Personal Communications Technology (handheld and small business wireless systems) can be used in the amateur service. A second Sunday workshop will focus on Wireless Networking using the WA4DSY 56K RF modem Technology. This workshop will focus on the technology and accessories of creating and maintaining 56K networks using the WA4DSY modem and equipment compatible with it such as routers, digital driver cards, transverters, and repeaters. Use of WA4DSY 56K equipment in the 219-220 band will also be discussed.

Local Co-Hosts

The 1996 ARRL and TAPR Digital Communications Conference is co-hosted by the Puget Sound Amateur Radio TCP/IP Group and Boeing Employees Amateur Radio Society (BEARS).

The Puget Sound Amateur Radio TCP/IP group is an informal group involved in an ongoing project to build and expand an amateur radio digital network in the greater Puget Sound area of the Pacific Northwest US. The Washington Experimenters TCP/IP Network (WETNET) uses TCP/IP as its primary transport protocol and currently has over 250 users. WETNET is linked to other amateur radio TCP/IP networks via the Internet. The Boeing Employees Amateur Radio Society (BEARS) is a general interest amateur radio club for employees of the Boeing Company, headquartered in Seattle, Washington. The BEARS are an active amateur club, supporting radio classes, VHF/UHF repeaters, and digital communications. BEARS has been instrumental in the construction of the Evergreen Intertie, an extensive network of interconnected repeaters in the Pacific Northwest.

What can you expect during the 1996 ARRL and TAPR Digital Communications Conference ?

* A full day of papers and breakouts on Saturday for the beginner to the advanced amateur digital enthusiast.

* Three workshops
Friday (4pm) - APRS, Conducted by Keith Sproul, WU2Z
Sunday (8am) - How to utilize Part 15 Radios for Ham Applications, Conducted by Dewayne Hendricks, WA8DZP
Sunday (noon) - Wireless Networking using the WA4DSY 56K RF modem Technology

* The first annual Student paper session.

* A banquet with Special Guest Speaker Lyle Johnson, WA7GXD
Lyle was one of the founders of TAPR and instrumental in
forming many of the current aspects of Amateur Digital
Communications. He is currently very active in building
several digital aspects of the upcoming Phase 3D satellite.

* SIGs (Special Interest Groups) on Saturday following the banquet.

* Informal get-togethers throughout the weekend.

* A meeting facility that is perfect for this type of meeting.

* Vendor area and informal engineering discussions/demonstrations.

* An event at which the most important new developments in amateur digital
communications are announced.

* Digital 'movers and shakers' from all over the world in attendance.

* Plenty of Washington State hospitality!

Conclusion

If you have attended a Digital Communications Conference in the past, just
remember back to how much fun it was discussing the latest developments into
the wee hours! If you have never been, then make your plans now to attend
and find out how much fun the Digital Communications Conference can be.

There are few activities where the importance of your participation can be
so much fun and important! What a great way to share and renew your
enthusiasm for digital amateur radio! Getting together with colleagues from
all over the world and bringing each other up to date on your latest work.
All this, and more, for an unforgettable weekend of ham radio and digital
communications. Make your travel and lodging arrangements now. We hope to
see you at the ARRL and TAPR Digital Communications Conference on September
20-22!

Full information on the conference and hotel information can be obtained by
contacting Tucson Amateur Packet Radio, 8987-309 E. Tanque Verde Road #337,
Tucson, AZ 85749-9399. Phone: (817) 383-0000. Fax: (817) 566-2544. Internet:
tapr@tapr.org Web: www.tapr.org

Sincerely,
Steve Ford, WB8IMY, ARRL Conference Co-Chair
Keith Justice, KF7TP, TAPR Conference Co-Chair
Steve Stroh, N8GNJ, Local Host Liaison
Greg Jones, WD5IVD, President TAPR

Note: If you need handouts or flyers for meetings, contact TAPR about
getting what you need!

Hotel Information

Conference presentations, meetings, and workshops will be held at the Quality Inn Seattle Airport, a complex co-located with the Radisson Hotel Seattle Airport. Rooms rates are $66/single-double and $76/triple. When making reservations with the hotel, be sure to indicate you are attending the ARRL and TAPR DCC conference. It is highly recommended that you book your room prior to arriving - a block of 75 rooms is reserved until September 6th, 1996. After the 75 rooms are booked, rooms will only be available in the Radisson hotel, but will be at a higher price. Be sure to book your rooms early! The hotel provides transportation to and from SeaTac Airport. You should contact the hotel to arrange airport transportation.

Quality Inn Seattle Airport (conference hotel)
17101 Pacific Highway South, Seattle, WA, 98188
(206) 246-7000, Fax (206) 246-1715

Radisson Hotel Seattle Airport (alternate hotel)
17101 Pacific Highway South, Seattle, WA, 98188
(206) 244-6000, Fax (206) 246-6835

Registration

Contact the TAPR office by Phone, Fax, or e-mail (Internet: tapr@tapr.org) to preregister or for additional meeting information. MasterCard and VISA accepted.

- Preregistration (before Sept 1st) $40.00 *

- Late Registration or at door $45.00 *

* - Conference Registration includes:
Conference Proceedings, Sessions, Meetings, and Lunch.

- Saturday Evening Dinner (Limited Space) $19.00 **

** - Dinner, Speaker: Lyle Johnson, WA7GXD, Prize Drawing

Workshops

APRS Workshop
Friday, 4pm - 7pm. Conducted by Keith Sproul, WU2Z

- Registration $15.00

How to utilize Part 15 Radios for Ham Applications Workshop, Sunday, 8:00am - 11:00am. Dewayne Hendricks, WA8DZP

- Registration $15.00

Wireless Networking using the WA4DSY 56K RF modem Technology Workshop
Sunday, 12noon - 3pm.

- Registration $15.00

Contact TAPR to register for the DCC.
Tucson Amateur Packet Radio, 8987-309 E. Tanque Verde Road #337, Tucson, AZ

4932. $50,000 per month - LEGAL

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-09-12 00:00:00 UTC
From: tesla@pop.magnet.at
Message-ID: <518ueu$emp@sun.magnet.at>
Source record: 34578
Cross-posted to: rec.photo.digital,rec.photo.equipment.35mm,rec.photo.equipment.medium-format,rec.photo.equipment.misc,rec.photo.technique.misc,rec.photo.technique.people,rec.radio.amateur.antenna,rec.radio.amateur.digital.misc,rec.radio.amateur.dx

$$$

Taking 5 minutes to read what follows can change your life :

I saw an article in an internet newsgroup telling me I could
make $50,000 within a month for an investment of only $5.

I thought it was a huge joke. I spoke to my wife, attorney
and friends about it, and they all agreed it was some kind
of scam. I can't stand scams, because usually someone gets
burned, and I didn't want it to be me. Of course, I rejected
the idea at first. after a short period of about two weeks
,I thought : "I have already heard of such things. But on
the Internet ?!?!? ". I decided that even if I had to throw
5$ into the fire, I wouldn't mind it that much, and gave it
a try .After all I needed a LOT more than five dollars.

Two weeks later, I began receiving money in the mail! I
could not believe it! Soon, hundreds, and then thousands of
dollars began to roll in. Within 4 weeks, I had received a
total of $32,445! It came from everywhere in the world. My
bank account has changed its "-" into a big "+" (++++)!!!,I
bought myself a car and things I wanted for a long long time
for my wife and kids!

If you follow the three steps below, there is no reason why
the same shouldn't happen to you! This is a legitimate
investment opportunity. You invest $5, and you receive a
return on your investment. So does the next investor. NOT
ILLEGAL, NOT A CHAIN LETTER- PERFECTLY LEGITIMATE.

If you are not interested, then don't participate, but
please print this article and pass it on to someone who may
be interested, so they can take advantage.

The procedure is simple: 1) Write your name and address on 5
sheets of paper. Below that, write the words, "Please add
me to your mailing list." Fold $1 note or bank draft or
money order in each piece of paper and mail them to the
following 5 addresses.:

1. Nir Levi,
PO BOX 342
Yavne, ISRAEL

2. Vic Williams
14307 Virtue Rd.
Lenoir City, Tn 37772 USA

3. Bill Brown
148 South Downlen #796
Beaumont, Tx. 77707 USA

4. Olivier Arcadipane
237 rue Francois Andre
7390 Quaregnon BELGIUM

5. Josef Malzer,
Brandhof 1
4701 Bad Schallerbach
EUROPE - AUSTRIA

2) Now remove the top name from the list, and move the other four names up. In other words, #5 becomes #4 and so on. Put your name as the fifth one on the list. Use a simple text editor such as Notepad, in your "accessories" window (If you have MS-Windows),or DOS editor. In fact, any editor will do.

3) Post the article to at least 200 newsgroups. There are 17,000, so it shouldn't be hard to find that many. Try posting to as many newsgroups as you can, and the bigger the newsgroup is, the more people are to see your message!

You are now in the mail order investment business, and should start seeing returns within a week or two. Of course, the more newsgroups you post to, the greater your return is. If you wish to remain anonymous, you may use a psuedonym, call yourself "The Manager", "The Boss", whatever but make sure your address is correct.

Now, here is why the system works:

-Of every 200 posts I made, I received 5 responses. Yes, only 5. You make $5 for every 200 posts with your name at #5.

-Each person who sent you $1 now also makes 200 additional postings with your name at #4. ie. 1000 postings. On average therefore, 50 people will send you $1 with your name at #4. $50.

-Your 50 new agents make 200 postings each with your name at #3 or 10,000 postings. Average return 500 people = $500. They make 200 postings each with your name at #2=100,000 postings=5000 return at $1 each=$5000.

-Finally, 5,000 people make 200 postings with your name at #1 and you get a return of $50,000 before your name drops off the list. AND THATS IF EVERYONE DOWN THE LINE MAKES 200 POSTINGS! Total income in one cycle=$55,000.

From time to time, when you see your name no longer on the list, you take the latest posting that appears in the newsgroups, and send out another $5, and put your name at #5, and start posting again. Remember, 200 postings is only a guideline. the more you post, the greater the return.

Lets review why you should do this. THE ONLY COST IS $5, AND 5 STAMPS, AND 5 ENVELOPES. Anyone can afford $5 for such an effortless investment with such SPECTACULAR RETURNS.

Some people have said to me, "what happens if the scheme is played out and no one sends me any money? "Big Deal, so you lose $5-but what are the chances of that happening ?? Do you Realize that NOBODY cares for the LEGAL chance of winning such a BIG money as 50,000.00 $$$$???? and all for a microscopic investment of five separate dollars? just think of all of the new Internet users that join the net every day!!!

There are millions of internet users, and millions of new net surfers every month !!! This is the great plus of the Internet, people all over the world can hear you and listen carefully if you talk reasonably. Everyone will take that chance ! I agree, If it wasn't the Internet, and was a small circle of people, the chance wouldn't have been so small. the amount of money had to be 200 times bigger, and the chances were zero. It wouldn't succeed.

But here, on the Internet, it is a giant village, where new thousands of members join in every day ! you CAN'T lose !!!!

Remember- read the instructions carefully, and play fairly. That's the only way this will work. Get a printout so you can refer back to this article easily.

Try to keep a list of everyone that sends you money and always keep an eye on the postings to make sure everyone is playing fairly. You know where your name should be.

REMEMBER-HONESTY IS THE BEST POLICY. YOU DO NOT NEED TO CHEAT THIS IDEA TO MAKE MONEY!! BESIDES,NOT PLAYING THE GAME FAIRLY IS ILLEGAL.SO LET'S BE REASONABLE AND PLAY FAIRLY,SO WE CAN ALL ENJOY THE INTERNET GOLD MINE.

GOOD LUCK FOR YOU ALL, And remember, play fair and you'll win, I don't want to mention what might happen to those who won't. AND AGAIN,SEE YOU NEXT TIME WITH SOMETHING YOU WANTED FOR A LONG TIME !!!

PS: How knows where I can get the Book from SHINICHI SEIKE (Title: "The Principles of Ultra-Relativity")
--> Please mail Information to: tesla@magnet.at

4933. Help: WEFAX & SSTV frequencies..

.....CLIPPED.....

>
WARNING!!!!!!!

The perpetuation of this ILLEGAL chain letter has caused poster to lose
Internet services in the US and Canada!

Examples:

"This is just to let you know that your complaints re: the "MONEY!!! - the
almight dollar - right here, right now!!!" message by Brendan Keeley have
been dealt with. Any furtur similar messages by Brendan Keeley will
result is his account being terminated. If you have any further questions
or concerns, please e-mail me."

Need More?

"Dear Internet User:

Sorry for the form-letter, but there were quite a few letters
expressing outrage about Mr. Keeley's Money!! Letter.

Mr. Keeley is very regretful about this incident, and has himself sent
us a letter suggesting we warn our other users not to make the same
mistake. We will do so this evening.

We wish to convey our apologies and add them to those of Mr. Keely who
has assured us that this post will not be repeated.

Brandi Jasmine "

That's just one guy!

REPEATING:Mr. Keeley is very regretful about this incident, and has himself sent us a letter suggesting we warn our other users not to make the same mistake.

Don't participate! You will make no money and only cause yourself trouble!

It was probably just an error in shipment. I've always found MFJ's
products to be of good quality.
Butch N2YMJ

Well to add a comment. MFJ does have some problems sometimes in
communications within their own offices. When I wanted to order one of
their MFJ1171 (Commodore Digicom Modems) their 800 opr at TECH office kept
telling me there was nothing wrong with the modems and they had like 200
sitting on the shelf collecting dust. Their 800 opr at SALES kept
insisting at first that they had "none". Then when confronted him with
the words of the TECH opr he said that was true but there was something
wrong with the modems thats why they quit selling them and were instructed
to just keep them in the warehouse. Another call to the TECH people and
they completely refuted that and said they sold them for years and no
problems whatever. One more call back to Sales and told them to ship
me one regardless. The guy was nonplussed, and said "you mean you want
us to ship you one even though we warned you something is wrong with
them. I replied exactly that "ship it". They did finally after a 2
month delay of phone calls after calls etc and the modem finally was
received and worked perfectly ever since. So they obviously have an
in house problem in comms between each other, but as to their products, I
would say FB!.

Well, we have already tried to explain that to our friend Christopher,
but he does not get it. "my modem says 9600 baud and I get a connection
so my transceiver works at 9600 baud" is his credo.

Of course, he has not responded to my challenge to measure the actual
throuhput while uploading a 200K file to a nearby user or BBS...

4942. X1J Diode Mutiplexer ?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-09-13 00:00:00 UTC
From: Ken Morris <kmorris@mail.powerup.com.au>
Message-ID: <3239986A.66E3@mail.powerup.com.au>
Source record: 34588

I have constructed a 4 port diode matrix circuit for the X1J Software for a Tiny 2 (Paccomm). This will be used for our emergency response group (called WICEN), so that a cluster of X1J's will be used to distribute traffic from a host PC. So, we have 3 TNC's and a computer on this diode matrix board. The application software on the PC runs KISS mode .

It was found that without handshake (ie disconnect CTS), that the KISS mode to the TNC's using a computer with BPQ, works well. The CTS seems to do funny things out of the TINY2.

On reset of the TNC, the CTS goes + 9v, and stays there until the node beacons (after a minute), then the CTS line goes to - 9volts and stays there forever!. This then sends -9volts to all of the other ports to pin20 (DTR), and of course stops them from transmitting.

Has anyone been in this area ?. Is it a bug?

The x-link mode and the CTS lines behaves normally, and have no problem. It seems it is only kiss mode. Be grateful for any comments to help me to help WICEN.

Thanks
Ken Morris

You can start with 14.320 MHz. for SSTV, and there is WEFAX near most
Marine bands on HF too.

Adios!

Rick

4948. Re: GRAPES 56K Modem, is it dead?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-09-13 00:00:00 UTC
From: brian@nothing.ucsd.edu
Message-ID: <51acqp$rra@news1.ucsd.edu>
Source record: 34594

I'm using the Hamtronics converters, but I have to put a Motorola
'seltzer bottle' bandpass cavity filter in front of the receive
converter to get it to stop hearing 900 MHz paging transmitters.

That's on 433.05 MHz.

I had intended to try the Hamtronics preamp that uses the Murata helical
resonators instead of the Moto cavity, but haven't yet. (It's not
a real whiz-bang preamp, but we're not doing weak-signal work here.
All I need is the selectivity.)
- Brian

4949. Datacom software for SoundBlaster ?

4950. INSIDER TIPS - Read it now

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-09-13 00:00:00 UTC
From: g.geco@universal.net
Message-ID: <51b97s$597@sun.magnet.at>
Source record: 34596
Cross-posted to: rec.photo.digital,rec.photo.equipment.35mm,rec.photo.equipment.medium-format,rec.photo.equipment.misc,rec.photo.technique.misc,rec.photo.technique.people,rec.radio.amateur.antenna,rec.radio.amateur.digital.misc,rec.radio.amateur.dx

Taking 5 minutes to read what follows can change your life :

I saw an article in an internet newsgroup telling me I could make $50,000 within a month for an investment of only $5.

I thought it was a huge joke. I spoke to my wife, attorney and friends about it, and they all agreed it was some kind of scam. I can't stand scams, because usually someone gets burned, and I didn't want it to be me. Of course, I rejected the idea at first. after a short period of about two weeks ,I thought : "I have already heard of such things. But on the Internet ?!?!? ". I decided that even if I had to throw 5$ into the fire, I wouldn't mind it that much, and gave it a try .After all I needed a LOT more than five dollars.

Two weeks later, I began receiving money in the mail! I could not believe it! Soon, hundreds, and then thousands of dollars began to roll in. Within 4 weeks, I had received a total of $32,445! It came from everywhere in the world. My bank account has changed its "-" into a big "+" (++++)!!!,I bought myself a car and things I wanted for a long long time for my wife and kids!

If you follow the three steps below, there is no reason why the same shouldn't happen to you! This is a legitimate investment opportunity. You invest $5, and you receive a return on your investment. So does the next investor. NOT ILLEGAL, NOT A CHAIN LETTER- PERFECTLY LEGITIMATE.

If you are not interested, then don't participate, but please print this article and pass it on to someone who may be interested, so they can take advantage.

The procedure is simple: 1) Write your name and address on 5 sheets of paper. Below that, write the words, "Please add me to your mailing list." Fold $1 note or bank draft or money order in each piece of paper and mail them to the following 5 addresses.:

1. Nir Levi,
PO BOX 342
Yavne, ISRAEL

2. Vic Williams
14307 Virtue Rd.

Lenoir City, Tn 37772 USA

3. Bill Brown
148 South Downlen #796
Beaumont, Tx. 77707 USA

4. Olivier Arcadipane
237 rue Francois Andre
7390 Quaregnon BELGIUM

5. Josef Malzer,
Brandhof 1
4701 Bad Schallerbach
EUROPE - AUSTRIA

2) Now remove the top name from the list, and move the other four names up. In other words, #5 becomes #4 and so on. Put your name as the fifth one on the list. Use a simple text editor such as Notepad, in your "accessories" window (If you have MS-Windows),or DOS editor. In fact, any editor will do.

3) Post the article to at least 200 newsgroups. There are 17,000, so it shouldn't be hard to find that many. Try posting to as many newsgroups as you can, and the bigger the newsgroup is, the more people are to see your message!

You are now in the mail order investment business, and should start seeing returns within a week or two. Of course, the more newsgroups you post to, the greater your return is. If you wish to remain anonymous, you may use a psuedonym, call yourself "The Manager", "The Boss", whatever but make sure your address is correct.

Now, here is why the system works:

-Of every 200 posts I made, I received 5 responses. Yes, only 5. You make $5 for every 200 posts with your name at #5.

-Each person who sent you $1 now also makes 200 additional postings with your name at #4. ie. 1000 postings. On average therefore, 50 people will send you $1 with your name at #4. $50.

-Your 50 new agents make 200 postings each with your name at #3 or 10,000 postings. Average return 500 people = $500. They make 200 postings each with your name at #2=100,000 postings=5000 return at $1 each=$5000.

-Finally, 5,000 people make 200 postings with your name at #1 and you get a return of $50,000 before your name drops off the list. AND THATS IF EVERYONE DOWN THE LINE MAKES 200 POSTINGS! Total income in one cycle=$55,000.

From time to time, when you see your name no longer on the list, you take the latest posting that appears in the newsgroups, and send out another $5, and put your name at #5, and start posting again. Remember, 200 postings is only a guideline. the more you post, the greater the return.

Lets review why you should do this. THE ONLY COST IS $5, AND 5 STAMPS, AND 5 ENVELOPES. Anyone can afford $5 for such an effortless investment with such SPECTACULAR RETURNS.

Some people have said to me, "what happens if the scheme is played out and no one sends me any money? "Big Deal, so you lose $5-but what are the chances of that happening ?? Do you Realize that NOBODY cares for the LEGAL chance of winning such a BIG money as 50,000.00 $$$$???? and all for a microscopic investment of five separate dollars? just think of all of the new Internet users that join the net every day!!!

There are millions of internet users, and millions of new net surfers every month !!! This is the great plus of the Internet, people all over the world can hear you and listen carefully if you talk reasonably. Everyone will take that chance ! I agree, If it wasn't the Internet, and was a small circle of people, the chance wouldn't have been so small. the amount of money had to be 200 times bigger, and the chances were zero. It wouldn't succeed.

But here, on the Internet, it is a giant village, where new thousands of members join in every day ! you CAN'T lose !!!!

Remember- read the instructions carefully, and play fairly. That's the only way this will work. Get a printout so you can refer back to this article easily.

Try to keep a list of everyone that sends you money and always keep an eye on the postings to make sure everyone is playing fairly. You know where your name should be.

REMEMBER-HONESTY IS THE BEST POLICY. YOU DO NOT NEED TO CHEAT THIS IDEA TO MAKE MONEY!! BESIDES,NOT PLAYING THE GAME FAIRLY IS ILLEGAL.SO LET'S BE REASONABLE AND PLAY FAIRLY,SO WE CAN ALL ENJOY THE INTERNET GOLD MINE.

GOOD LUCK FOR YOU ALL, And remember, play fair and you'll win, I don't want to mention what might happen to those who won't. AND AGAIN,SEE YOU NEXT TIME WITH SOMETHING YOU WANTED FOR A LONG TIME !!!

Hello Rob.

>Well, we have already tried to explain that to our friend Christopher,
>but he does not get it.

I get it just fine my friend...you are comparing apples and oranges.

The original issue was the way I answered the other users question.
Did I answer his question correctly...yes.

>"my modem says 9600 baud and I get a connection
>so my transceiver works at 9600 baud" is his credo.

My transceiver DOES work at 9.6k...but is it the best radio to use, the
answer is no.

But does *IT* work flawlessly on 9.6k...with a high TXD, the answer is yes.

Stop putting words in my mouth, and reading what you want into posts.

Thank you, and take care.

4955. First use of compressed forwarding?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-09-13 00:00:00 UTC
From: Roger Barker <roger@peaksys.demon.co.uk>
Message-ID: <tCGkdCAFBdOyEw1g@peaksys.demon.co.uk>
Source record: 34601

I've just read a packet bulletin on the UK network from someone who claims that compressed mail forwarding was originally his idea. I presume that he means no-one else used it before he thought of it. That quite surprised me, because I always imagined it would have been introduced in the very early days of packet BBS development.

I was active on packet in the early 80's then there was a gap until about 5 years ago, so I don't know when all the various improvements in BBS forwarding came along. If anyone has any knowledge they could pass on as to when compression was first used, and on what BBS software, I'd be very interested to know.

"Ka-node" is Kantronic's version of their firmware node. It is built into
their TNCs, and is not as powerful as a software driven node, but then, you
dont have to leave a computer on to run it either. :)

Kantronics has just introduced new firmware thats supposed to be much stronger
than their current Ka-node, but thats all the information I have at this time
on it.

Take care.

>73, Jim KH2D

The fact is, Jim, that your ten year old radio is likely to be a whole lot better for 9600bd than most new "9600bd ready" radios.

Rod.

Greetings:

I also am a Mac/packet peson. I use Saviant 1.0.2, and Soft Kiss 1.9.1
wit the Poor Mans Packet Tnc that was in the 73 magazine several years
ago. I also use a 1270C with the MFJ software package. I run a 6290CD and
several different radios, ie IC27H, IC211, RS 202, Regency XLH250B. I also
have an SE that I am dedicating to packet so I can surf the net and packet
also.

Let me Know if I can be of any assistance

4961. Minimize chip Count (PAL/GAL Programming SVC)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-09-13 00:00:00 UTC
From: dthimm@unix.newnorth.net
Message-ID: <51a4gi$ahe@unix.newnorth.net>
Source record: 34607

NOW YOU CAN HAVE THEM TOO!

Discrete TTL/CMOS technology is old fashioned and cost you lots in terms of space and power.

The software and equipment needed to program your own PAL/GAL chips can cost in the thousands.

PAL/GAL technology can reduce chip count up to 90% and in many cases are faster than TTL/CMOS technology.

This saves you time, money and board space.

If you can describe it and it can be programmed, We can program it.

Custom logic chips are a lot cheaper than you think.

We specialize in providing quality fast turnaround to individuals, students, hobbiests, companys -- whatever the situation.

Try for the latest "InfoMagic" CD set and install the latest SlackWare.
That's what I did and it has been working well ever since.

> 2. If I buy a Linux CD (in the UK they seem to cost *more* than Win95!),
> presumably I'm going to have to look elsewhere to find the bits specific
> to ham radio, such as the AX25 drivers? What's a good starting point?

The InfoMagic CD set contains snapshots of the SunSite and TSX archives,
so there is plenty of software included.

> 3. I have one PC on which I could install Linux to "have a play",

> could functionally carry on doing what it is doing at the moment?

Not too easy, but possible. I would estimate about 6-24 hours, including
reading documentation and configuring everything. Installation is
straight-forward and shouldn't take more than about an hour.

Hope that helps,
Jens, DB9LL

There are many Internet to packet gateways. A somewhat out-of-date list is on minnie.cs.adfa.oz.au under the name 'resource'. There are some good gateway information files also on that site. Most gateways require passwords for access, but do ip routing between widely spaced areas via the Internet. some have NETROM routing as well.

A KA-Node is a Kantronics implementation of a Node that resides in
the TNC firmware. It's generally considered to be a major hassle
integrating one into existing Node networks.

They do, however, offer a new node implementaion with their KNET
firmware, which is reportedly much more compliant with existing node
software.

A trip to my home page reveals there are many good files and programs for amateur radio operators that want to use Mac computers.

<http://www.mv.com/ipusers/wd1v/>

* Ham Radio Test Simulators - where you can go from Novice to Extra Class practicing the actual tests right on your Mac! Check out the info on the new NO CODE license or scramble your neurons and learn Morse on the Mac too!

* Macnet Roster - a virtual "Who's Who" HyperCard stack with more than 750 entries giving the names, addresses, phone numbers, of radio operators all over the world that are using Macs. Check out their projects and their passions and put a design on your Mac Radio future when you see what neat things are being done!

* Mac Ham Radio Software Listing - as the name implies, its "The List" of the latest - much of it with FTP links so what you see is what you can

get with just a click.

* Ham Radio.FAQ - compiled on a Mac with a lot of links to great Mac FTP sites for radio, electronic engineering, and similar data.

4970. GRAPES 56 K Modem, is it dead ?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-09-14 00:00:00 UTC
From: wb9mjn@wb9mjn.ampr.ORG
Message-ID: <11016@wb9mjn.ampr.org>
Source record: 34616

Hi Gary,

My point has little to do with the technical merits of TNC's versus other controller technologies. The term "TNC" was meant to encompass all controller types, that a modem would be attached. A pi card/packet twin, or TNC still costs money.

That $ 50 dollars worth of parts probably results in a 100 dollar finished product cost. But worse, the 10 meter IF output requires another 100, in the cost of the transverter (for 440 application), over an I/Q Radio solution.

Transverters were originally designed to allow expensive HF radios to be re-used for weak signal VHF/UHF application. This way, the expense of the HF radio, or other 10 meter SSB exciter/receiver, justifies the transverter expense.

The 10 meter IF also avoids FCC Type acceptance. But, an I/Q modem would not need to type accepted, either.

☐☐I didn t say an I/Q radio was direct conversion. Did I ?

I believe I said "optional" coherent demodulator, in my message. That is, it would be user selectable.

Yes, its vaporware. But, isn t that what a TNC was before 1984? If there s no market, it wont be built. If the DSY 56 KB modem doesn t have the 10 meter IF as a plug in option, there will be no market for an I/Q 440 radio. That is kinda why i m making these comments. To see if there is a way to move forward on the RF side of things.

>technically skilled/computer-savy folks away with the code requirement.

Years ago that was correct. When packet was enjoying its first burst of activity, there was not yet a code test free license and it was harder to create a critical mass. That's not as true at VHF+ now where we do have a code test free license, but now we have to fight an established inertia toward the slower methods. That's a problem, but we're dealing with it, and it would have existed to some extent even if Morse testing had never been an issue.

The Morse requirement is still a problem at HF, but restrictive rules are a bigger problem there. The rules were shaped around RTTY, plain text, and plain FSK. They express a narrower is better bias. As people who've studied communications theory know, narrow is not always better. There are situations where it is better, and other situations where it is not. Many of the modern techniques fall in the latter category.

HF in general is plagued by too many restrictive sub-bands. This is hindering fuller exploitation of the resource. As Phil Karn has noted, use of SS technique on HF would have very large benefits toward more effective utilization of the resource. And of course systems like Piccolo and the NATO STANG modem require a larger bandwidth in which to operate than is permitted, yet they use the bandwidth more efficiently than most current narrow techniques so the net effect is that congestion should actually decrease. Narrow technique is not necessarily always inferior, however. There are cases where narrow is best. We should retain the flexibility to go either way as the situation warrants.

There's a good bit of truth to this. This obsolete paradigm is
a costly hinderance. I constantly see people tying up as much
money in a 1200 baud station as it would cost to run 56 kb.
This is ridiculous. It is an educational problem, however. The
task is to show people the better way and explain the benefits.

You don't understand, Carl. Jim has touched on a very real problem.
Data networks are 90% people and organization, and 10% technology.
We have the technology in hand, that's not the problem. The problem
is to have the people and organizational structures in place to erect,
operate, and maintain the network. This is expensive, time consuming,
and requires an enormous amount of planning, coordination, and politicking.
This is where critical mass becomes vital.

It is necessary to develop a consensus among a large enough group to
form a critical mass in order for a network to be successful. In essence,
a club has to be formed in much the same way that clubs are formed around
regular voice repeaters. We call them LANs (though technically they should
be called MANs). And there needs to be an umbrella structure erected to
encompass multiple LANs, tying them into one coherent network. Generically,
that's a WAN, in Georgia, we call this GRAPES. It is structured as a club
of clubs, IE its members are the actual LANs it encompasses, not individuals.

Forging the consensus is the hardest part. As Jim notes, when you get a group of hams in a room, it gets mighty cramped due to all the big egos involved. It requires a deft political touch to get all these people to agree on what to have for lunch, much less on how to structure and build a network. We were fortunate to have a few people with just such political skills. This still didn't happen overnight. It took years of work, and still takes work to hold it together.

As with most voluntary organizations, the main problem is that 100% of the members have opinions, but only 2% are willing to actually do any work. Those 2% can be easily burnt out if you're not careful. There's no way that a small core networking group can maintain a statewide network by themselves. In Georgia, the mileage alone is daunting. So each LAN is charged with maintaining its own equipment, and contributing to the maintenence of the interties. That way the workers don't have to chase all over the state all the time.

It takes money and people to build a network. The money isn't that much, but the people are absolutely critical. Ongoing recruitment and training are required to replace workers as they burn out, or ideally to rest them before they burn out. A network with lots of downtime quickly ceases being a network. The net has to function, and it has to function reliably. Outages have to be corrected promptly. That takes dedicated and trained people. There are never enough of them.

We've had problems from time to time in this area. We've burned people out, we've had prolonged outages, and we've had problems holding the network together as a result. The job isn't over when the last piece of hardware is installed. It's just beginning.

The problem is that the network developers get bored when the network is completed. They want to go on to other things. So a different group has to be recruited and trained whose main focus is maintaining and operating the network. This wasn't obvious to us in the beginning. It is painfully clear now.

People, people, people, that's what networking is about. The more people you have, the better job you can do. And to get those people to work together requires politics, politics, politics. It isn't always pretty, but that's the way it is.

yv4fnc> BAYCOM TNC. Please, if anyone knows how to do that, i
yv4fnc> will be much appreciated... 73's de Jose..!

Hola Jose,

Lo unico que necesitas es una copia del programa AX25.COM, que puedes
encontrar en ftp://ftp.ucsd.edu/hamradio/packet/tcpip/baycom/ax25*

Arrancas el programa con los parametros necesarios segun el puerto
serie al que tengas conectado el modem BayCom (velocidad, direcciones
de I/O e interrupcion).

Luego, en el fichero autoexec.nos debes anadir una linea del tipo:

attach packet ax0 0x60 5 512

No tengo el fichero a mano, pero es mas o menos asi, de todos modos
en el fichero de documentacion que viene con el ax25.com da la linea
adecuada.

Para que la linea anterior funcione, es necesario que tu JNOS tenga
compilado el soporte para drivers del tipo "FTP Software Packet
Driver", vamos, el que se suele usar para las tarjetas Ethernet.

Eso es todo, yo lo he hecho asi desde hace mas de dos anyos y funciona
perfectamente.

Que haya suerte. 73's.

>All I need is the selectivity.)
> - Brian

It's not bad. I used one on a 70cm voice repeater for several years.
It gives a bit steeper skirts than the "seltzer bottle", and the
preamp makes up the filter loss so sensitivity doesn't suffer.
NF isn't improved, but it isn't degraded that much either. As you
say, this isn't weak signal work.

Dale likes interdigital filters. There's a program (Java enhanced)
on his web site to design them. You can get respectable rejection
without much insertion loss with this, and you can tailor the
skirts to a greater degree than you can with just a can.

4982. The truth about Juno mail.

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-09-14 00:00:00 UTC
From: Burt Fisher <k1oik@ccsnet.com>
Message-ID: <323B40F6.6429@ccsnet.com>
Source record: 34628
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.digital.misc,rec.radio.amateur.policy,rec.radio.amateur.homebrew,rec.radio.amateur.misc

I hear packet stations pushing JUNO, read this:

At JUNO the customer philosophy appears to be "the customer comes last."
I had an account with them (kotzebue@juno.com) and as you will read
below I supported them strongly. However they have a rule if anyone at
all complains about you they will terminate your service. It does not
matter whether the complaint was justified or not or even if it had
anything whatever to do with your JUNO account, you will be terminated.
What is even worse I was terminated without ANY notice and they
were unresponsive to any EMAIL (except their automated replies). Also if
I tried their tech support and I was on hold for a long time and when
you do get through they did not followup (so I do not really know why my
account was cancelled or even if it is a technical problem, I am
surmising I was removed). Thus if you had set to receive all your Email
via that account, you are screwed as those that write you will have
their mail bounce back.

Even when JUNO works it take me several calls to avoid crashes, hangups etc.

Now I do have another JUNO account as their software was simple to
overcome and simply sign up another account. I was inconvienanced by the
termination but only a bit as I had two other Email accounts.

Here is what I told them when they said they had a complaint about them.
(I got NO response).

FIRST I am one of your biggest supporters. I have sent out messages to
over 50 friends who were interested in your service. The more users the more
revenue you gain from advertisers.

I send no internet users unsolicited messages from my Juno account.
I post to the internet via my Internet Service Provider, which is not
you.

If I have my address listed in a signature how does that violate any
terms of an agreement? You are well aware almost anyone will complain about
almost anything on the internet.

I only send messages to those that send me messages except in a few rare cases.
I will be mindful of your concerns but please do not defend those that would
make false and/or misleading claims.

As far as violating the terms of the agreement, I read the terms and the
only thing that comes close follows:

3.4. . You agree that you will not interfere with any other person's use and enjoyment of the Service or any other online service.

That sentence is impossible to comply with as written. If I post a message saying I do not like Nazis (which I did) that can be inferred as "intefering with someone's enjoyment of any other online service." Thus do expect all your users to have no opinions on anything? If you wish to deny me service based on that provision I will go from being your greatest advocate to a very unhappy former customer and just as I have not kept my pleasure of using Juno to myself, I will not keep my displeaure to myself either.

Burt Fisher

Here is the complaint they sent me which caused me to respond above:

On Tue, 06 Aug 1996 13:07:53 -0400 Juno Postmaster <postmaster@juno.com> writes:

I don't see how you can say that. The I/Q radio still needs an IF strip,
mixers to the operating frequency, and power amplifiers on the operating
frequency. The transverter supplies the latter two things for us, and we
build in the IF strip. You need the same bits either way, the only difference
is in how you package the bits in the two boxes.

> Yes, its vaporware. But, isn t that what a TNC was before 1984? If there s
>no market, it wont be built. If the DSY 56 KB modem doesn t have the 10 meter
>IF as a plug in option, there will be no market for an I/Q 440 radio. That is
>kinda why i m making these comments. To see if there is a way to move forward
>on the RF side of things.

The option to use your I/Q radio has existed for 8 years. No one built
one. GRAPES has never been real fussy about how you buy the kit. We'd
have sold just the encoder and decoder to someone who had an I/Q radio.
But no I/Q radio ever materialized. Therefore when the new modem was
designed, the integration offered by going to a single board outweighed
any considerations of such a vaporware radio.

In my opinion, by the time a suitable I/Q radio does appear, the
encoding and decoding will be done in DSP, so the point becomes
moot anyway. The GRAPES modem fills a niche *now* so that people
can get on the air *now* with 56 kb using off the shelf transverters.
What we'll be using in 10 years will probably be entirely different.

Your TNC analogy doesn't hold any water because FM radios *did*
exist to allow it to be used. That's not the case here. The I/Q
radio does *not* exist as a product people can own. It makes
absolutely no sense to market a modem which is unusable because
the necessary radio does not exist. Do you expect buyers to plunk
down their money and then just *hope* someone might build a suitable
I/Q radio sometime in the future so that their investment isn't
totally wasted? IBM might get away with that, but GRAPES can't.

Distribution restricted from bogus world to realistic uk, not that it will
make much difference.

In article <$Uu0hAAkD8NyEw$g@peaksys.demon.co.uk>,
Roger Barker <roger@peaksys.demon.co.uk> wrote:
>
>2. If I buy a Linux CD (in the UK they seem to cost *more* than Win95!),

I didn't realise that Win 95 cost less than GBP 3 (the typical price of
a magazine with Linux on a cover disk). [1]

The typical price for a 6 CD Linux compilation set should be around
GBP 20 (The Computer Bookshop, in Holborn had the April 6 CD set at
GBP 18-95 last weekend, and about a month ago had some sets from last
year at GBP 9-95). Note that there is a new Info Magic CD set in
the distribution chain at the moment.

The compilations have multiple packagings of Linux, plus a lot of other
software - the only limitation is that some software authors don't
permit CD distribution.

I suspect you are looking at CD plus book packages. The CDs actually contain
the documentation, but only have a very basic getting started guide on
paper.

Most of the CD ROM houses have FTP sites, where you can preview content lists.

[1] Of course, the way that MS control the market means that you will find it
difficult to get any discount for not having '95 on a new PC, as the retailer
gets a bulk discount on condition that every PC has it installed.

Use modem 18, the one the TNC knows as 9600.

BTW: what firmware do you have? I've heard of a new version but
haven't heard from AEA. I have 1.00. And it will NOT work KISS
on the 9600 modem... its a known bug.

Uli, you can get the latest TAPR 1.1.9 eprom from TAPR
(http://www.tapr.org) or the next-most recent (1.1.8a) code is available
from there to burn your own eprom (also ftp.tapr.org).

Compatible eproms are also available from PacComm and possibly MFJ.

You will probably need to upgrade your TNC to 32K of SRAM, since the
early ones only had 16K. Information on this is also available from the
TAPR site or you can purchase the chip from TAPR.

I realize that this might be the wrong place to post this, but I
couldn't find anywhere better to post this...

I'm trying to make a laser-tag game. I already have the whole firing
and recieving system down-- Actually, the suits themselves send out infrared
pulses with their identifying "code." The "gun" of the suits reads that code
instead of shooting a focused beam.. What I want to happen next is for that
suit that recieved that code to transmit the code on a radio frequency. So,
when a suit hears its own "code" it knows it has been hit.
I know very little about radio transmitting and recieving. I'd like
a fairly good range on the transmition-- the guns themselves have a range
of about 100 yards, so I'd like the radios to be able to go further than that.
Does anyone know of a good way of doing this? I realize I'll probably have to
register with the FCC before doing this. If anyone knows how I can easily
do this so that it's somewhat small and somewhat light (the unit will be
mounted on the belt of the suit) and relatively inexpensive ($20-$50 is what
I'm thinking) please e-mail me at desco@purdue.edu.

Thanks

: Hello Mary. I have a newer FT 736. On 6 it should put out 10 watts in the
: FM mode. If your not getting full pwr out, carefully check all your
: connections and the SWR. If your SWR is high, the rig automatically
: "folds" back the output pwr tp protect the rig. I found that by putting
: an SWR/PWR meter between the rig and my amp the rig would put out full
: pwr. Another trick is to trim a short piece to until you get a flat SWR
: and full pwr. Good luck..Oh Yaesu will deny any knowledge of a problem.

Trimming the coax will NOT affect the actual VSWR, although it may "fool"
the rig into thinking that it is operating into a matched load. This is
because the input impedance of the coax varies with coax length.

The reason it does not affect the VSWR is that the match between the
coax and the antenna are the only factors. You cannot do anything at
the input end of the coax that will affect the VSWR.

Hello, Folks:

I have just put up my new home page and invite all to drop in for a look. Included at the site are the following areas:

Ham Radio -- Mostly packet, mostly high speed

Pipe Smokers -- Very, very much still under construction

Astronomy -- Mostly Amateur Radio Astronomy (good 2nd interest for Hams!)

Mapping -- Mostly about elevation maps

Heartland Internet Services -- Lots of Web Presence information

The URL to use is:

http://www.trucom.com/ppages/marty

Thanks!

Take Care & 73

Hello, Folks:

I now have Packet Bulletin Export Files available on my Home Page.

The files are split by distribution group. I now have the following available: ALLUSA, WW, EU, CANADA, ARRL, AMSAT, and NASA. Others may be added as needed.

Files will be posted daily and should be online after about Noon Central Time.

Just point your Netscape 3.0 or MS Inetrnet Explorer 3.0 browser at:

http://www.trucom.com/ppages/marty

and go to the Amateur Radio area. The rest should be clear to all.

Take Care & 73

5004. pk-96 and TCP/IP ?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-09-15 00:00:00 UTC
From: ape@spacetec.no
Message-ID: <51h585$lkl@nms.telepost.no>
Source record: 34643

Got a PK-96 modem today.
Read in the manual that it support TCP/IP , but the documentation
is poor on that speficic item.

Have anybody used TCP/IP with the PK-96 modem ?
Is it just to use the "KISS" command and use SLIP (serial line IP) ?

I want to use FTP,telnet,mail and WWW.

Thanks for any reply.
PS! I'm no radio amateur

If you are looking for information on the Kantronics KPC-3, try the Web.
Search for "Kantronics", they have a nice homepage. I have a KPC-3
which I am just learning how to use, so can't be of much help to you.

Good luck,

>daunting. So each LAN is charged with maintaining its own equipment,
>and contributing to the maintenence of the interties. That way the
>workers don't have to chase all over the state all the time.
>

Good idea ... put the burden on the folks who use the stuff.
I'll go along with that ... the core techno-weenies can *train* the
locals, as necessary, to install and maintain their own LANs ... and
devote more of their time to designing new goodies and planning for th
future. Sounds like the best allocation of resources to me.

>
>The problem is that the network developers get bored when the

> products to be of good quality.

If they have a problem, it's that their products are designed to be inexpensive; i.e. cheap. Either that, or they were severely underengineered.

I've seen several of their "300 Watt" antenna tuners that have been burned out with nothing more than barefoot 100W rigs. (Yes, they were operated properly.)

A personal experience was with the MFJ-1270 (no suffix) TNC. They used an 1/8" "earphone" connector for power. Of course, I managed to pull the plug out part way and fried the wall wart. (The 1270B model uses a proper coaxial connector.. as does mine now.)

Want more? Ask anyone that owns the data radios.

Most AEA TNC default to the DCD line to the PC being permanently high.

You must send the command "DCDCONN ON" so the DCD line will show the
connected state. Once you've done that, in WinPack "Comms Setup", set
"DCD shows conn YES".

If it still doesn't work, check that the DCD line is connected in your
cable!

You need an xNOS stack running in your computer, and the
PK-96 running KISS. Look for TNOS and JNOS and other xNOS's at
ftp://ftp.ucsd.edu/hamradio/packet/tcpip. And also check
ftp://ftp.ucsd.edu/hamradio/packet/tcpip/incoming for newer
versions.

5011. Baypac 1 & 16550 UARTs?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-09-16 00:00:00 UTC
From: btbanko@prairienet.org
Message-ID: <51iro1$avj@vixen.cso.uiuc.edu>
Source record: 34507

I just upgraded my motherboard from an older 486DX-40 system with old BIOS to a newer system with an AMD 5x86-133 processor, and now my Baypac 1 modem isn't working properly with Baycom 1.5 software.

Has anybody else had this problem? The software works for about 60 seconds, but then goes into a "send" mode (without actually keying the radio) and stops working. Do the 16550 UARTs not support the power sourcing of the RS232 needed by the Baypac or something?

Thanks in advance for your comments. (I am also going to try to contact Tigertronics about this problem.)

Thanks for all the info. The last cover CD I had with Linux on it was
from PCW. Someone commented that the release on it was "out of the ark".
I think the last thing a newcomer wants to do is to install a version of
software that is already obsolete.

I thought that Linux had a version numbering system that differentiated
between stable versions and development versions, or something like
that? None of the replies to my question have yet mentioned what version
number I should be looking for.

And, on another note.

Is anyone using the INTERNET to tie together NETROM (The NET) type Nodes
in order to have reliable DX type connections?? I believe there were
telephone "wormholes" many moons ago, but is anyone doing this across
the INTERNET?? Is anyone interested?? I have considered reviving my
NOS<->INTERNET box here at the University, but radio access to the
INTERNET is hardly practical when you figure you can get real access for
less than $20.00 a month. But reliable access to many corners of the world
on VHF Packet might be fun. especially for those who would prefer liesurely
conversation "your 59. good bye."

Hi,
Can either of you make any comments as to which (the 232 or the 2232)
is "better" for satellite work? Money really isn't an issue, and I like the
capability of being able to do two channels on the latter.
Also, someone told me that I should be looking for "G3RUH" compatibility
so that I would be able to do a modification allowing the modem to do 56Kb/s
on 23cm. Is any familiar with this, and will these modems do this?

Thanks.

Hello? TCP and IP are level 4 and level 3 protocols respectively. You can
not use them naked. You have to have a level 2 protocol under them.
On ethernet it is the MAC layer, on VHF+ radio it is AX25, or something
that serves the same purpose as AX25. AX25 has some warts, but you
can avoid them if you just use its UI datagrams and forget the VC stuff.
There's no real need to change this.

On HF you want to use a more robust link level protocol. For multipoint
packet switched networks sharing a common channel, you need a receiver
driven DAMA protocol to get the most out of the channel. We don't have
one of those, and that's something we need to develop. But for point to
point links, Clover will serve nicely. Since these have to be supervised
links anyway, the autoforwarding restriction is a moot point.

You're railing against a non-problem. The TNC is an obsolete paradigm,
but the link level protocol it implements is still needed. We just
pull it back into the switch firmware instead. The beauty of TCP/IP
is that it doesn't care what link level protocol it runs over. We
can pass data over AX25, Netrom, Rose, etc. It doesn't care. Of
course we care if the link level is efficient, so Netrom and Rose
aren't very good choices, but plain old AX25 datagrams work just
fine on VHF+.

Jeeze, Carl, you're every manager's nightmare. You have a way of
phrasing things that manages to piss off everyone. Our structure
is not top down, it is bottom up. The LANs *are* GRAPES, and the
"techno-weenies" *come* from the LANs. They aren't some distant
group who come to town and impose their way of doing things on
the locals. (That way most emphatically does *not* work in a
voluntary organization. Been there, done that, got burned.)

The process is essentially *cooperative collaboration*. The process for continuously keeping maintenence staffed is "each one teach one". In other words, local "weenies" take on local apprentice "weenies" and guide them into becoming full fledged "weenies" too. (Frankly, we prefer the term *wizard*.)

Bradley> Thanks in advance for your comments. (I am also going to
Bradley> try to contact Tigertronics about this problem.)

Hi Bradley, a friend of mine had the same problem when he upgraded his computer to a Pentium PCI motherboard with integrated 16550 UARTS. The modem worked great in his 486 with 16450 UARTS but stopped doing so in the new computer.

It seems there is a bug in BayCom 1.5 (and 1.5a too) that prevents it from working with FIFO UARTS. Once he upgraded to BayCom 1.6 the problems disappeared. The modem he was using is the *real* BayCom one, so I can't tell you if this will work with the Tigertronics one. But if you can get a copy of 1.6, the test is worth it.

Hope this helps you.

Most of the CD-ROMS available have version 1.2.13, which is quite
stable, but lacks many of the features of the newer kernels. There are
some now out with 2.0.0 or later which are mostly reasonably stable.
Look for Debian 1.1 or Slackware 3.1 distributions. I expect that Red
Hat and others will have new releases quite soon. The 2.0,x kernels are
"stable", but there are still bug-fixes going in, as opposed to new
features, which should show up when the 2.1.x series starts, although
the difference is sometimes hard to discern.

I find the 2.0.x series quite stable for my applications, but some folks
may differ.

Message-ID: <323E03DF.441D@midstate.tds.net>
Source record: 34518

I'm running APRS 75C (unregistered) and can't get it to copy
the local TheNet X1J4 node onto the position page or map. It's beacons
are formated as per the instructions in protocal.txt (I think). The
same station copies my moving GPS/tnc standalone just fine, so I assume
the program's OK and it's something in my BT format on the node.
Any suggestions or hints?

5023. ACARS - ACT-1 Thoughts, Questions, etc

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-09-16 00:00:00 UTC
From: ken@winograd.com
Message-ID: <ken-1609961939330001@man-nh4-27.ix.netcom.com>
Source record: 34519

Hello ACARS fans! I just bought the ACT-1 ACARS decoder and software from Universal Radio, and thought I'd share some first impressions, and also very much hope to get some additional ACARS info from anyone else willing to share.

The unit is a little decoder within a "gender bender"-type of RS232 plug. It plugs easily into a serial port, and allows piggy-backing another serial device (so you don't really lose a serial port.) It installs easily, and works like a charm (sort of). That's the good news. The bad news is this is a pure DOS program, and is extremely basic in its capabilities. It cannot seem to run from a DOS window within Windows 95, at least not in my first attempt to do so.
Out of the "gender-bender" interface is a wire that you plug into the line or speaker output of your scanner.

I tuned my scanner to 131.55, opened the squelch, and "let her rip!" (The packets are so short, if you wait for the squelch to open, you just might miss the packet altogether!)
Within a few seconds, I started getting ACARS packets, and almost all of the short second-long-or-so screeches that I heard resulted in a line of ACARS information. I was very pleased about that.

Some of the "packets" resulted in "proper" information...it was obvious that the packet of information printed was correct. I live near an airport (MHT) and was actually able to verify the registration number on the tail and the flight number on the actual jet with the information I saw recorded on my ACARS unit. (Cool!) BUT...I'm also getting garbage and garbled packets of info too. I know ACARS packets include a BCS (block check sequence) and if the info doesn't arrive correctly, it is re-transmitted. It appears, though, that the software that comes with the ACT-1 either doesn't know how to perform the validity check, or I don't know how to engage it. (I always allow room for cockpit error on my part, so to speak.) Does anyone know whether the ACT-1 performs some kind of validity check on the info received, or does it just put on the screen whatever it thinks is a packet of info without any checking? Does AEA programs do the same? Other decoders?

I'd love to learn more directly from the authors of the program too. Does anyone know the author of the program that comes with the ACT-1, or their email address, or a web page for them? Does anyone know sources of info on getting pictures of actual ACARS units in jets, or the ground station units? I'm open to any kind of ACARS-related info. The packets I'm getting are often very interesting, and I'd love to get more involved, but I need to learn more. The ACT-1 came with an excellent book called Understanding ACARS, but it, too,

is just a beginning. Does anyone have any info on the format
of ACARS packets, and on the possible different kinds of packets,
and how they are to be interpreted, etc, etc.

Thanks very much for any info offered...

Ken

Hi Guys:

Well, I'm using the "shell" part of my Internet account to telnet to a local packet gateway. I got permission from the sysop to do that and he assigned me a password. Then, I can connect via any of his ports to other packet digipeters around the world. Pretty cool! No vhf rig, no tnc, just Procomm, Telix, or any other terminal program will work with your modem. I've even telneted to a Moscow digipeter/bbs at 44.178.1.2, and found a local bpq switch on his node list and connected to my netnode "ezmony" on 146.090 via HOUBPQ. Using this technique lets me check packet email from the office or anywhere a fone line is available, even from the car if I really pushed it!

>TNC-based kluges should be abandoned

Uh, waitaminit. IP has to be carried by SOMETHING from router to router,
or host to host. Casting it into the wind in raw form doesn't work real
well.

You want a reliable link protocol to carry IP; right now AX.25 does this
as well as anything else we have. Certainly there are BETTER ways to do
it and the rules shouldn't specify what, but don't confuse one level of
the protocol with another!

The advanced ham networking people have been seriously discussing using
PPP over connected-mode AX.25 as an entry-level protocol stack, and
there are a number of good reasons for doing so. For the casual ham
users, this isn't bad. At 9600 bps, it'd work acceptably well for
a lot of occasional dabblers in digital ham radio.

Nothing works well at 1200 bps and slower. Carrier pigeon would be faster.

The ham network, if it ever is to exist, will require something better
than 9600, of course.

5032. Software decoding of FSK modulated signal

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-09-17 00:00:00 UTC
From: Daniel Ayers <daniel@securicor.co.nz>
Message-ID: <323E1DB0.3896@securicor.co.nz>
Source record: 34528
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.shortwave,rec.radio.scanner

Hello Everyone,

I am developing a program to decode FSK modulated signals using a SoundBlaster soundcard. The plan is to digitize the signal from the radio's audio output and then analyse it in software to produce binary data for further analysis.

I pretty much know how FSK works (this is not AFSK), I have hooked the radio up and digitised some test samples.

My question is: What are the best techniques for decoding the FSK signal into a binary stream?

I have seen this done using a data slicer circuit based on a 741 IC, some resistors and capacitors ... however I want to do it entirely in software using a soundcard.

I know it can be done, as I have a program that receives HF FAX transmissions via a soundcard. I have obtained a suitably fast PC for this application, so the analysis can be performed in real time.

My best guess at this stage is that once you have worked out how to divide the signal into bits (ie. time quantums depending on the baud rate) you need to work out how many cycles occurred in that period - which of course gives you the frequency.

Does anyone have any experience doing this? Any sample code or other technical information?

I'd appreciate any pointers.

Regards,
Daniel.

Easy way is to look for zero-crossings. Either work out how many in a
period of time , or time between crossings to get frequency. These
may not perform well on weak/noisy signals in the presence of other
interfering signals.

Harder ways include writting digital bandpass filter code or transform
code (Fast Fourier Transform is fun to play with!) which should
perform better in the presence of interference.

Note I'm no expert in this field, just played a bit with a Gravis
Ultrasound sound card and the Fast Fourier Transform to decode MSF
time signals on 60Khz (which is a bit of over kill, but it was
interesting).

Most soundblaster cards don't have the lower cutoff frequency low
enough for 9k6 FSK, so it does not work on many Soundblaster card.
WSs (windows sound system, a hardware standard) cards are much
better in this respect, I have successfully used one for 9k6 PR.

> My question is: What are the best techniques for decoding the FSK signal
> into a binary stream?
Look at http://www.ife.ee.ethz.ch/~sailer/ham/ham.html
It's in german, however

Find a copy of 73 for October 1989. On page 31 there's an article
entitled "Put your IC-22S on Packet" by Michael S. Dooley. Maybe
a local ham club has back issues. Or try 73; they might have back issues
and if not, I think they will photocopy the article (1page) for a fee.

I'm curious, Daniel, , , , Why are you trying to reinvent the wheel?
If it is just an excercise in design and building, I can understand
it. There is, however, software and hardware on the market that does
just what you are trying to do. Try the "Personal Code Explorer" and
it's software. I think that it may be what you want.
This isn't a shot, just curious, , , :-}

The TNC-3 name was also used by NJ7P and N7LEM for a prototype
80186-based replacement for the TNC-2, which never went into production,
so there might be a bit of confusion here.

Hello Dr OM .
For your information there is a SOUNDBLASTER driver for 1K2/9K6 operations
for PC/FLEXNET 3.3e SYSTEM ... I've never seen it working but as the author
says " IT WORKS ! "
PC/FLEXNET seems to be the most interesting system to work with other MODEMs
than TNC-2 or BAYCOM ...

Well, Miguel, from one Mike to another, here's help!

Look first in the following frequency ranges. All are in Mhz!

3.500 - 3.750 * Hours of late evening and darkness
The slowest speeds will be in the area from 3.650 up a ways.
The fastest speeds will be from 3.500 to about 3.550 or so.

7.000 - 7.150 * Hours of late afternoon and darkness though mid morning.
The slowest speeds will be in the area from 7.100 up a ways.
The fastest speeds will be from 7.000 to about 7.040 or so.

10.100 - 10.130 * All hours
Speeds are generally faster here, period...

14.000 - 14.150 * Daylight hours and all but middle night hours.
The slowest speeds will be in the area from 14.050 up a ways.
The fastest speeds will be in the area from 14.000 to 14.050.

21.000 - 21.250 * Daylight hours and less at night.
The slowest speeds will be in the area from 21.050 up a ways.
The fastest speeds will be in the area from 21.000 to 21.050.

There are more ham bands with CW in them, but these will get you started.
In Portuagal, the assignments vary from these postings, but here in the USA
this is a good guideline. If you are learning the code, once you have the
letters memorized, try hard to learn to receive it by NOT necessarily writing
it down! It is more important just to be able to recognize a letter by the
sound and say in your mind, aha!, I heard that! Then as you get better at

it, you just hear more letters until, prestamente, you are hearing them all.

Writing it down takes two mental steps. First you hear and go aha!
Then you have to write what you understood. That takes twice as long to learn to do. Better to simply learn to hear in your mind and write later, in a funny kind of a way. Code is like music; we appreciate it better than we can write it down or conduct it!!!

Copying code is an art.

Mike @ W5WQN

5049. PK232 & Pactor

FBB runs very well under OS/2. I have been running an FBB/OS2 system for about 4 years now with very good success.
You need to set OS/2 up properly in order for the Com ports to work properly. You can use the Com drivers that come with OS/2 (COM.SYS and VCOM.SYS) or you can get the better ones (SIO.SYS and VSIO.SYS) from Ray Guinn and just about any OS/2 support BBS or file server.
Read the OS/2 docs as to how to properly set up the drivers in your CONFIG.SYS or the SIO docs if you decide to use them.
Once that is done, create a DOS session for FBB and load the FBB com drivers just the same as a DOS computer. i.e. load your ESS or MBBIOS or BPQ or whatever first and then start FBB on top of them in the same session.
Unlike Windows, you probably won't even notice a performance decrease with FBB running on an OS/2 system.
Good luck

Hi Jim,
NiCd batteries do not have any kind of overcharge protection. If
you overcharge the battery (In this case by leaving it in the
charger), the battery capacity will be degraded.
Good luck!

: So Daniel, give us some more clues, what is the desired
: application/modes/Rx type/data rates......

My main interest right now is in the data tones used by local emergency services, with secondary interests in FAX/RTTY/CW/etc.

Actually what's happening on the air and in the radio aren't so important, the issue that I'm looking at is...

given an audio output from a (A)FSK signal - ie. an audio tone of changing frequency - what is the best way to demodulate that waveform into frequency-versus-time and then into binary data?

I know about the zero-crossing method, and I can apply that in software. Are there any better methods?

The data rate won't be high. Our ambulance service puts FSK data over their voice channel - I believe it's pager traffic, so I'd imagine data rates of 600 or 1200 baud, 2400 at the outside.

I reckon I have it mostly figured out, the next question is how to work out where the bit boundaries are. ;-)

Daniel.

Dr Pepper (cheshire@ridgecrest.ca.us) wrote:

: I'm curious, Daniel, , , , Why are you trying to reinvent the wheel?

Because I need a square wheel, and everyone else's is round! :-)

Yes, I'm aware of the data slicer circuit, the Universal M400/M1200/etc
and all those other decoders.

What I want to do is multi-channel demodulation/decoding of digital
signals. I want to monitor/analyse/record certain things, like the
tones our fire and ambulance services use, and I'd also like to demodulate
RTTY/FAX/CW (as a secondary interest).

There are two reasons why the various kits and off-the-shelf products are
no use to me. First, they all need one PC per channel (as they invariably
use DOS software). Secondly, I want to do some realtime analysis and have
actions taken (eg. paging me) when certain things occur.

And there's always the cost factor. ;-)

I've set up a fast PC running Linux with (initially) one soundcard. That
system digitises the audio output from the radio (scanner). That's all
working. Once I have done the demodulation step, its then simple to write
software to decode the demodulated data into whatever type of traffic I'm
listening to.

It's not a particularly hard thing to do, I have a fair idea how to do
the demod - I only asked because I knew other people have done this with
a soundcard before and I wanted to know if someone knew a better way.

For the record, at this stage it appears that the "zero crossings" method
(ie. basically a software implementation of the data slicer) is the best
way to go.

Daniel.

Jim,

If the FT-11 can be powered directly from a 12 VDC source, that is the best way to run it for the long term. Use the battery only when portable operation is required.

73,

Rich

I am an inactive ham with an advanced license who has not kept up with the hobby. My dad dabbles with digital HF rig and a 2 mtr. handheld. My daughter live in Chile and has e-mail. My dad has an 8086 with a 10MB harddrive. He is in a rural area with maybe one Internet provider as a toll-free number. I don't know of a Fidonet BBS near him. Would it be practical for him to use packet for E-mail? He is at 2500 ft. above the Sacramento Valley with a pretty good location if he needs to get an antenna up a pine tree (he gets good VHF tv from Sacramento 100 miles away with a pine mounted antenna.
If packet is practical, what kind of equipment do we need? What are some models to look for?

This will likely fall apart badly in the presence of even trivial amounts
of noise. And if you managed to make it work, it probably wouldn't be
very simple either...

>Harder ways include writting digital bandpass filter code or transform
>code (Fast Fourier Transform is fun to play with!) which should
>perform better in the presence of interference.

What follows isn't likely to be optimal, but it is simple:

Rather than a full-blown FFT, you could simply do one slot centered
on the frequency Fmid = (f0+f1)/2 where f0 and f1 are the tone frequencies.

So you'll have two tables:

S is a sin(-2.0*M_PI*Fmid*Ts*i) for i=0 to N-1 samples
C is a cos(-2.0*M_PI*Fmid*Ts*i) for i=0 to N-1 samples

where Ts is your sample interval, and how N is chosen is left as an exercise.
Note that as indexes increase, you are going back in time (ie, to earlier
samples).

As each sample comes in, you add it to a table X of the last N values
taken. Compute s and c:

s = S.X, ie, S[0]*X[0] + S[1]*X[1] + ... S[N-1]*X[N-1]
c = C.X, (ditto)

ie, your basic FIR computation.

Then with s and c in hand, compute:

phase = atan2(s, c)

This quantity alone is not important. It is how it *changes* that is the key. For example, if f1 is being received, and is the higher frequency, then as successive values of 'phase' are computed, it will "increase" (the expected value is (f1 - Fmid)*Ts*2.0*M_PI radians per sample). If 'f0' is being received, then 'phase' will "decrease".

You probably get the idea: keep track of the last 'phase' computed, compare to the current. Call the difference dphase. Subject this to some weak smoothing -- a simple exponential filter will likely do -- and should the smoothed 'dphase' be above some value, you can decide you are receiving a "1", below some othe value a "0".

Actually, you'll likely want to use a better algorithm than that (indeed, if you are a FEC kind of guy, simply *don't* decide what the value is -- pass up the probability, a "soft decision" as it is called, to the FEC decoder to deal with). And I haven't addressed the issue of deciding where the data edges are -- what the cognescenti call "clock synchronization" -- but all this is what books are for.

> I Know also the MOTOROLA MITREK.Have you experience with these radio ?
The TEKKs are available in the 440 band, they are crystal controlled - so you need to specify the frequency you want. Their output power is low - about 2 watts - so you may need an external amplifier. You will also need an external voltage regulator - to supply about 10 v dc max to the unit. I have one, it has worked ok for me.

The Mitreks are very good also. They are surplus taxi or police radios, and are built like tanks. I don't know how available they are in Italy. They are crystal controlled also, so you need to get the "Frequency Elements", with the proper crystal in them. You need to retune the RF sections to get the output on the correct freq. They are available in power levels from about 35 watts to 200 watts, depending on the model. I have 2, 1 that works well, and another that doesn't work at all.

I think I'd go with the TEKK - it closer to "Plug and play", unless you are an RF technician, with a good test bench.

Source record: 34545

Hi Gary,

The difference in the cost between the transverter and the I/Q radio, is that there are mass produced chips now, that can do the I/Q modulation, right on the output frequency. Thus combining the I/Q modulation, and final conversion into the same stage. Additionally, transverters are still built in an amplifier by amplifier discrete method. And also with a multiplied up LO chain.

The I/Q radio option does not exist today, nor did it 8 years ago, because of economic reasons. The fact that the DSY modem is not a modem , but a 10 meter data radio, precludes the savings a I/Q radio would give the system. Because the system still has to include the costs of the 10 Meter I/Q radio within the DSY kit/product. One does not save money, by spending it on things one does not use. But, beyond that, the chips to do this were not availbale 8 years ago.

Now, don t take me too literally. The I/Q modulation stage may have an IF in it. My point is that , in one small space on a C.B., its possible to go from baseband to final frequency.

73, Don.

[SNIPed an interesting idea...]

Matthew, I'll give you're ideas a try and see how it works.

I have been playing with full-blown FFTs and getting very good results on
low speed data. It's fun to tune a SSB Rx to some aviation beacons
that send very slow CW idents, and look at the spectrum. A single
frequency for the carrier, and to single tone side-bands as the id is
keyed :-) Proof the sidebands are real :-)

Hello,
I am N2NNU, Alex. I have been involved with high speed lans for
15 years now. I have seen de birth and the demize of at least
a dozen protocols and harware solution. And I have seen the standardisation
of perhaps the worst of them, the Ethernet. It all happen
just because of greed, non compliance and ego !

For us, the amateurs of the world to succede in this endeavor
we need to have the guts to reinvent our self. We need to
tell the legislators tha we need INCENTIVES to build the
next generation of HAMS. We need to grow the previousely
stated %2 of REAL Amateurs to as much possible. But
when they can-t use THEIR equipment to call in for a pizza
there in no much incentive to build new infrastructures
on top of the aging ALOHA.

We need the equivalent of the IBM to generate and build
universal standars and hardware and we need the equivalent
of Microsoft to help us be better users of the system.

It is a shame that we have left the entire market and hoby
to the whims of the foreign manufacturres. We need to
subsidise and create incentives for our hoby to grow and
thrive.

We need to do it now, before we are losing our precious
resoureces.

John,

From all reports, the DSP-232 is still in beta testing. (Yes, I know it is for sale.) Lots of bugs, and missing features. Some users have new eproms which fix a few things and add other problems. I recommend you hold off a bit. Now that Mike Lamb is back running things I have a lot of confidence that AEA will clean up the mess that Rod Proctor left behind, but it will take a while.

Alan

All who picked up on the "Stray" on p.35 of October QST will be relieved to learn that it's not your FTP client that's the problem, downloading Brian Beezley's NF.ZIP from the published FTP site. An appeal to ARRL HQ elicited this correction (and, it works!):

Stan,

Greetings from the ARRL Technical Department! The NF.ZIP software was removed from ftp://n6nd.nosc.mil because of space limitations. The current source for this software is as follows:

ftp://oak.oakland.edu/pub/hamradio/arrl/bbs/programs/nf.zip

Best Regards, Michael Tracy, KC1SX, ARRL Technical Information Services

Isn't using IP on top of a UI AX25 datagram for all intensive purposes,
using them "naked"? I mean, you have no underlying transport layer other
then IP. It was my understanding that the whole AX.25 encapsulation mess
came about as a way to satisfy U.S. requirements. I do know there is a
driver out for NOS (from Poland) that will drive a radio directly
from the UART port (a modified form of SLIP). I've also used a
Livingston
PortMaster running slip to talk to a multipoint spread spectrum based
network we have set up here in Farmington. (and in fact thats how I am
posting this message)

However, I do agree with Brian Kantor. Some sort of underlying transport
layer really helps on long circuits (like AX.25 VC mode). That way you
error check on your most fragile path (the radio path).

Regards,

Jeff WB8WKA

5083. A ProComm Plus Script to Control the AEA MemoryMaster Keyer

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-09-19 00:00:00 UTC
From: "Don L. Miller" <dlmiller@fishnet.net>
Message-ID: <32420007.4C06@fishnet.net>
Source record: 34479

I have written a ProComm Plus Aspect script which is designed to be used
with the AEA MemoryMaster Keyer. You can download it at:

http://www.fishnet.net/~dlmiller/mm3.html

The MM-3 is a dandy device for learning the morse code. You can hook
it up to your computer and take advantage of its built-in QSO simulator
to prepare for your next upgrade. Everything sent by it will appear on
your monitor.

If you have your paddle plugged in, you can even talk back to the MM-3
during a simulated QSO. It will learn your callsign, your name and even
your QTH. The ultimate diplomat, the MM-3 will assume that any
inability
to copy your morse code is due to QRM rather than a "bad fist"!

The MM-3 also has the capability to send you random practice code
groups.

System requirements are:

ProComm Plus (DOS or Windows)
The AEA MemoryMaster Keyer (also called the MorseMachine or MM-3)
A IBM-Compatible PC with a VGA Monitor
The Serial Port Cable described in the MM-3 Manual
A paddle (Optional -- If you want to "talk back" to your keyer)

Installation instructions are included.

No, AX25 serves a real purpose. It forms the MAC (Media Access Control)
layer for the upper layers. Here are some of the things it does.

1) It provides the CS part of CSMA by holding off transmission when
another carrier is sensed on the channel.

2) It provides the leading flags needed to synchronize the HDLC clocks.

3) It provides the Txd to handle transmitter and receiver settling times.

4) It provides a way to avoid repeated collisions through its p-persist
and slottime parameters.

5) It provides the hardware addresses in its header to which logical
IP addresses are mapped (via ARP). (Hardware and logical addresses
must be separate if multiple protocols are to be supported.)

6) Its PID byte allows multiple higher level protocols to co-exist
to/from the same hosts, simultaneously.

7) It offers a checksum for initial packet validation, thus minimizing
the CPU time required to discard a faulty packet. (Otherwise the
packet would have to traverse layers all the way up to TCP before
being validated.)

8) It also offers the ability to discard packets which aren't addressed
to the hardware address (call sign) of your station, again reducing
wasted CPU time.

It does more things as well, but that's a good start. AX25 plays the
same role over radio that MAC plays over ethernet. And for the same
reason, because they both use shared resources. If you are using a

non-contending point to point link, like a leased (or dial up after call setup is completed) phone line, or a duplex radio link on an exclusive frequency, then you don't need much of a MAC layer at all. But if you are sharing the channel with other stations, you must have something like AX25 to permit it to work.

VC mode, IE AX25 connected mode, basically duplicates the TCP transport function, and is usually just an undesirable overhead in a network where all switches support TCP/IP. It is of some use if intermediate relay sites can't comprehend TCP/IP routing and packets must be source routed between TCP/IP hosts. It is really just a kludge from the days when amateurs used no network or transport protocol and just depended on the horrible layer violation called AX25 connected mode as their transport layer, and did the network routing function by hand using source route statements in the digipeater fields. I'd suggest its use be avoided today.

I tend to agree with this. My opinion is that the 'no business
' rule on ham radio is overly stringently defined. I don't
want to see commercial businesses on the ham bands, but I think
some lightening up would allow us to do more cool stuff.
I've heard so much anal retentive rules lawyering on ham radio
to make me comatose.

>We need the equivalent of the IBM to generate and build
>universal standars and hardware and we need the equivalent
>of Microsoft to help us be better users of the system.

I see the lack of standards and of cool new stuff as an
opportunity more than a problem. I think the problem is
more organizational. If you do a new communication technology
you need more people doing it. Know what I mean? Who wants
to build a 110K baud packet if there's no one else to talk to.

Most exotic ham radio technology has to take place on microwaves
where the bandwidth is, so it's even more important to have
a buddy close by who you can work with. I don't think it takes
that many. I guess if you have 4 or 5 people doing say, ATV or
high speed packet in an area once a week, then you could get
others to start building boards.

I'm not an expert on what it takes on the radio side, but it seems
to me that the problem is mainly getting the bandwidth. If we
had a transciever that was pretty much like any other box we have
now, but could transmit signals of higher bandwidth, wouldn't that
provide a bedrock for all kinds of interesting experimentation.

I would like to buy new 56K RF modem from Paccomm.
Does anyone teach me some questions.

The old type WA4DSY 56kb RF Modem is needed PI2 interface card. What interface card is needed on new type 56kb RF Modem ? If any inetrface card except PI2 card is used, does this interface card supported NOS (DOS) or Linux ?

Which type does the transverter need normal type, or any specified type ?

Thanks,

The FCC has recently relaxed the content rules. I'm satisfied
with the new rules. They couldn't be much more free without
having to allow for profit business activity on the amateur
bands.

>>We need the equivalent of the IBM to generate and build

Bingo! We do *not* need an IBM ramming a crippled architecture
down our throats, and we do *not* need a Microsloth foisting
bloated and inefficient software down our throats, GUI GUI GAH!
The consequence of setting standards too early is that we're left
dealing with legacy systems and hardware and software that has to
be backward compatible for decades. That kind of thing we do not
need. Digital radio is still rapidly evolving. We do not want to
shackle it to legacy standards too early.

People are the critical resource. That's dead on the money.
Networking is 90% a people organizational effort and 10% a
technical development effort. Both are necessary, of course,
but without a critical mass of users, hardware development

alone is of little use.

>Most exotic ham radio technology has to take place on microwaves

>had a transciever that was pretty much like any other box we have
>now, but could transmit signals of higher bandwidth, wouldn't that
>provide a bedrock for all kinds of interesting experimentation.

I think the really exotic stuff will come on HF. That's the most
challenging radio environment. In terms of raw speed, the microwave
bands are where it is at, but speed is easy in a strong signal
gaussian noise environment like point to point microwave. There
is very little which is challenging there. It is point and shoot.

I think that the RF front end and the digital back end have to
be quite tightly coupled for best performance. Thus I think that
RF modems rather than "digital ready" radios are the direction
we need to take. Certainly we can do generic I/Q transmitters,
but generic I/Q *receivers* for high rate data are quite a different
thing. We still need analog filters at an IF tailored for the
particular signal design to get the performance we need for high
rate signals.

For the lower rates possible at HF, DSP already allows us to
directly process the I/Q signals, but not yet for high rate
modulations. Economical DSP is sneaking up on 56 kb, and I
would expect that to be practical shortly, but T1 and above,
that's going to be a while. So we'll have to brute force that
the old fashioned way for quite a while longer. Fortunately,
that's pretty easy, and we have bandwidth to burn at the
microwaves. We can even use plain old wide shift FSK.

What you need is a heads up display. You can do this with a transmission LCD and a projection system. That puts the text right up there on the windshield so you can still watch where you're going. These things still cost big bucks, but if you can find some company upgrading to VGA from the earlier CGA transmission LCDs, then you can often get the old system for free. CGA is good enough for text. Rigging up a projection system in the cab can be a challenge, of course. You'll probably want it to peep out of the sleeper over your shoulder. You'll need a dimmer for night use.

You can also use a projection TV for CGA text, but you usually can't get that bright enough to read in daytime. Works Ok at night, though, and you can watch tapes from your VCR if you get bored with packet. Don't watch car chase scenes though, that gets too confusing. :-)

Note, this latter may be illegal in some states. They ban TV from the line of sight of the driver, but they don't mention VDTs, projection or otherwise. So projecting text is probably Ok, but watching movies probably isn't.

That's a hoot. Norman Abramson at the University of Hawaii (ever
heard of that place?) developed something called ALOHA in the 1970s,
which really was the original packet radio network.

If you're interested in making informed comments on the topic,
I suspect your library at the school there has plenty of info,
probably even all of the papers that were published.

We learned about 10 days ago of a proposed new law in the State of Washington that would have required certification of all mobile radio installations by the State Patrol. We contacted the State Patrol and our state representative, Brian Thomas. As a result, the proposed draft has been thrown out and the scheduled public hearing on the matter has been cancelled. Today the State Patrol has advised us of new wording for the proposed rule - wording that no longer appears to have an impact on Amateur Radio operations. You can read the complete story in an EXCLUSIVE story published at Ham Radio Online at http://www.hamradio-online.com

I'll re-order these slightly, though keep the same numbers:

>1) It provides the CS part of CSMA by holding off transmission when
> another carrier is sensed on the channel.
>
>3) It provides the Txd to handle transmitter and receiver settling times.
>
>4) It provides a way to avoid repeated collisions through its p-persist
> and slottime parameters.

But these are channel-access issues; the radios and low-level
interfaces deal with this. At this point, the packet is yet
another bag-o-bits to squeeze out the radio and nothing more.

>2) It provides the leading flags needed to synchronize the HDLC clocks.
>
>7) It offers a checksum for initial packet validation, thus minimizing
> the CPU time required to discard a faulty packet. (Otherwise the
> packet would have to traverse layers all the way up to TCP before

> to the hardware address (call sign) of your station, again reducing
> wasted CPU time.

Technically, I suppose this is correct since the AX.25 specifications go
on about HDLC and the sort. But HDLC is almost a channel thing too --
just another way of recognizing that a packet is there.

>5) It provides the hardware addresses in its header to which logical
> IP addresses are mapped (via ARP). (Hardware and logical addresses
> must be separate if multiple protocols are to be supported.)
>
>6) Its PID byte allows multiple higher level protocols to co-exist
> to/from the same hosts, simultaneously.

When you get down to it, this is really *all* that wrapping an AX.25 envelope
around IP packets does.

Well, that, and in the United States, keeping millions of hams out of jail. :-)

>[VC mode] [...] I'd suggest its use be avoided today.

I'd go farther and suggest that use of UI AX.25 frames ought to be avoided. This because the UI frames are not acknowledged or re-transmitted, etc, one is implicitly depending on the higher level protocols (eg, TCP) to perform these functions.

This is a mistake, as anyone who has tried to run TCP over a non-outstanding AX.25 radio link knows all too well -- TCP stands a good chance of backing off to infinity or two minutes (whichever is shorter), and throughput drops to almost zero. This is not a bug in TCP, but rather a TCP design feature (good behaviour on congested networks) that conflicts badly with typical amateur radio reality.

[Actually, it is not limited to amateur radio -- other wireless networks suffer the same problem. For one proposed, but alas not too useful, solution to this call up altavista and do a search on "Snoop Protocol".]

IMHO what is needed is a new link-layer that provides:

a) items (5) and (6), given above.

b) non-connectionless, low-overhead, frame retransmission

c) some measure of FEC to keep (b) from being invoked often.

d) anti-HTS -- how many more years must the chaos continue??

e) slim-and-trim headers -- bit-hack to the extreme (though within reason), so the protocol can be used relatively painlessly on on both slow-speed and very high-speed channels.

and maybe,

f) zlib data compression (dictionary generation/selection would be an interesting problem).

Since this here newsgroup is intended as a forum on miscellaneous digital issues in amateur radio, perhaps some discussion on this will ensue?

According to my manual, the FT-736R output is 25 watts on 2 meters and
70 CM. The 6 meter module is rated at 10 watts. These figures are
about what I get when using FM, however, the reading on SSB is much
lower (yes, I am using a peak reading watt meter)

Note that X.25 does it the same way, and the ISO folks also tend to
have connection-oriented service repeated at each and every level.

Of course, today it is considered inefficient. But it certainly wasn't
an amateur invention.

>KH2PZ

Why am I not surprised? Aloha is a channel sharing technique first developed by ARPA in the 1970s, and is used in VHF amateur packet networks. Aloha is a simple technique to implement, but offers only 20% of a fully loaded channel's capacity before congestive collapse sets in. It is thus well suited to simple low loading networks, but fails when network loading increases above the critical threshold.

For years, amateur packet channels had light enough loading that Aloha was sufficient. But today the load factors are higher, and a better method is required. Aloha assumes a network of hidden terminals communicating through an exposed node terminal, IE a digipeater. To move past the Aloha limit, hidden terminals must be made visible by the network. Digital repeaters can serve this purpose. This allows the CS in CSMA to work on the LAN, thus reducing collisions, and increasing channel throughput.

There are other sharing strategies, for example token passing, round robin (also known as slotted Aloha), etc, which could be used. But the other techniques have problems for ad hoc networks. Aloha networks are simple to join and leave. Digital repeater based LANs share that attribute while not suffering from the congestive collapse limit of pure Aloha.

The purpose of a layer 2 protocol is to *manage* layer 1, IE the
physical layer. That's what AX25 does here.

>>2) It provides the leading flags needed to synchronize the HDLC clocks.

Yep, just what a layer 2 protocol is supposed to do.

Nope, but the PID is a useful thing for a mixed usage channel, and
the physical hardware addresses are essential.

>Well, that, and in the United States, keeping millions of hams out of jail. :-)

US amateurs are not required to use AX25 unless they are participating
in an unattended automatic message forwarding network.

>>[VC mode] [...] I'd suggest its use be avoided today.

Not implicitly, *explicitly*. That's the *job* of the transport layer.
It is why there is a layer 4. That job should not be pushed down to
layer 2 where it doesn't belong. Unfortunately, connected mode AX25
does kludge it down there, which is why I suggest mode VC not be used.

>This is a mistake, as anyone who has tried to run TCP over a non-outstanding

>off to infinity or two minutes (whichever is shorter), and throughput drops
>to almost zero. This is not a bug in TCP, but rather a TCP design feature
>(good behaviour on congested networks) that conflicts badly with typical
>amateur radio reality.

Indeed, the transport layer is the proper place to deal with packets
dropped due to collisions. It is redundant to do so elsewhere. Using
retries at two different layers requires a layer violation to prevent
packet storms, and neither layer violations nor packet storms are good
things. The exponential backoff in TCP may seem too altruistic to amateurs
who prefer to bull into pileups rather than to take their turn in an
orderly fashion, but the latter course offers more aggregate throughput
for the network.

Now packet loss due to physical layer problems, IE weak fading channels,
excessive multipath, etc, should be addressed at the physical layer
by better RF path engineering and/or by better signal design. Depending
on ARQ for all of the packet reliable delivery issues isn't a good
division of resources. It is supposed to be a backup mechanism to
deal with issues the physical layer can't handle. As with any backup
mechanism, it is nice to have, but it isn't something you want to
have to *use* frequently.

>[Actually, it is not limited to amateur radio -- other wireless networks suffer

>
>IMHO what is needed is a new link-layer that provides:
>
> a) items (5) and (6), given above.
>
> b) non-connectionless, low-overhead, frame retransmission

A connectionless link layer has the potentially very large benefit
of allowing dynamic routing on a packet by packet basis at layer
3. Amateurs haven't yet exploited this very much or very well, but
it is a powerful way for the network to self-heal or manage congestion,
and shouldn't be discarded lightly. I think self-healing in amateur
networks is so important that I very strongly discourage link layer
connection oriented protocols. And I much prefer to have my packets
routed around congested nodes rather than be choked there after
connection setup as they can be with connection oriented link
protocols.

> c) some measure of FEC to keep (b) from being invoked often.

FEC is really a layer 1 issue, like RF path engineering and signal
design. The link layer may need to manage it, but it doesn't need
to implement it. This is a grey area, though, and I'd accept FEC
as belonging in either layer depending on implementation factors.

> d) anti-HTS -- how many more years must the chaos continue??
>
> e) slim-and-trim headers -- bit-hack to the extreme (though within
> reason), so the protocol can be used relatively painlessly on
> on both slow-speed and very high-speed channels.

The bulk of the header overhead is in the 12 octets of physical address
information for origninator and receipient. I don't see a realistic way
of assigning unique physical addresses in less than 6 octets. Indeed, the
IP logical address space has recently been expanded to accomodate the
demand for unique addresses, making the IP header longer. As activity
increases, we have to recognize this need for address space and accomodate
it in header design. Vancouver protocol tried to use only one octet for the
physical address, and it rapidly became obsolete when more than 255
amateurs in an area decided to get on packet (and with HF and interconnected
packet networks, the relevant area is the world). The 6 octets representing
a call sign may be sufficient to amateur needs, though some amateurs have
run out of SSIDs, and the uniqueness is guaranteed by the governments
worldwide.

>and maybe,
>
> f) zlib data compression (dictionary generation/selection would
> be an interesting problem).

I think data compression is better left to the application or presentation layer, but I'm willing to consider placing it lower in the hierarchy. I see problems if layer 2 header information is compressed, and packet by packet compression is inefficient at best. It is better to do compression on reliable data streams, and those are found only above layer 4.

I tried this game successfully on a Zenith 386-25 Laptop with a Baycomm
deal and 1200 baud patch cord to my Yaesu Ft-530. I could drive around all
day long in the truck connected to a local digi on 144.95 and remain connected
to the cluster for as long as the cluster would let me stay without kicking me
off for non-support!]

The little BayComm TNC built right into the RS-232 connector works just
fine for this and even your earlier Zenith should have plenty of RS-232
speed to work 1200 baud I/O to it.

That isn't the problem....

I found out something. Until voice I/O makes it into mobile applications,
typing on a keyboard and watching a Laptop LCD screen is for the VERY
strong of heart! It takes a strong constitution to keep the big rig 'tween
the ditches and keep up a keyboard conversation with an LT.

I do know of touch typists that can do a WONDERFUL job of CW I/O using
keyboards in a mobile rig bolted to the steering wheel. However, if you
think you can read that LCD screen, type and pay attention to driving,
I'd like to meet you and see you do it...

These cop car digital I/O deals are fine so long as it's a two man show...

>something better ... and maybe get some ideas going ...

Well, Carl, there are certainly other ways to implement the
link layer. Token ring is one, round robin another, and a
DAMA method is still another. If the network depends on
CSMA, however, AX25 datagram mode serves well enough.

You really have to look at the topology and nature of the
physical layer network to determine what makes a good link
layer protocol for it. I addressed some of these issues in
another reply.

And there's what I call a "social" aspect as well. Amateur networks
are typically ad hoc, often forming and dissolving relatively quickly.
That's one of our strengths (as well as one of our headaches). Token
ring networks are hard to enter and leave gracefully, and round robin
or other imposed scheduling systems require a central scheduling authority
which is vulnerable to single point failure. So most amateur networks have
retained simple CSMA architectures, and for that AX25 datagrams are good
enough at the link layer.

We could stand improvements at layer 1, IE better RF engineering, better
signal design, etc, and we could add some self-healing properties to layer
3 via a workable dynamic routing mechanism, but layer 2 is adequate as it
stands for the types of networks amateurs typically form at VHF+. (HF is
a different matter. Because of the topology, and the nature of the medium,
other strategies are required.)

The big problem I see when people say "lets fix AX25" is that the
problems they are really complaining about require fixes at other
layers, not another kludge to layer 2. In fact many of the problems
are *caused* by the kludges already thrown into AX25 that they shouldn't
be using, such as VC mode. AX25 is like a Swiss Army knife. It can be

a pretty good knife if you'll leave the dang corkscrew and can opener
folded out of the way.

>an amateur invention.

I don't mean to imply that it was. Amateurs did agree to include
it in AX25, however, and that was a bad decision (IMHO) forced by
amateur politics (there were two extreme camps, one vehemently VC
and the other vehemently datagram, they were locked in a room and
told to come to a compromise). There was a lack of true network and
transport layers in amateur systems at the time, but the correct
solution to that (IMHO) would have been to adopt network and
transport layers, and not try to kludge them onto the link layer
where they don't belong.

Of course hindsight is 20-20, but there is good reason to obey
layer separation of roles. That's because it lets you somewhat
painlessly replace your mistakes without tearing down the whole
structure. Kludges are ugly, and they always remain ugly, no
matter how much goop we layer onto them.

>
> Has anybody else had this problem? The software works for about 60I had the same problem when change to an AMD 5x86-133 with a new
motherboard.
In the Baycom site(when it was working, 2 months ago) they say the
trouble was linked to a software problem and the 16550 UARTs.
They sugest to use a common IDE for the COM1/2 and not the I/O
connection of the new motherboard.
As a alternative you can stay with the COM1/2 connected to the
motherboard's I/O, install an adictional IDE, configurated as COM3/4.
Naturally this will work with Baycom 1.6. The v1.5 is compactible
only with COM1/2 (Or can it operate in COM3/4??)

>VC mode, IE AX25 connected mode, basically duplicates the TCP transport
>function, and is usually just an undesirable overhead in a network where
>all switches support TCP/IP.

This is what we thought a few years ago. Unfortunately, we've since found out that it isn't true, and the 'connected mode' AX.25 has since proven to have advantages over datagram mode even when carrying TCP/IP traffic.

The reason is (in hindsight) simple - ALL of the TCP retry algorithms are end-to-end, and are nearly ALL predicated on the assumption that the network discards IP packets for only one reason: router congestion. TCP was simply not designed to efficiently operate in a lossy network.

Were there a reliable datagram version of AX.25, we wouldn't have to use connected mode. There isn't.

What is proving to be the better solution now is that point-to-point links (i.e., from your home station to the local switch, or station to station, or switch-to-switch) operate in a reliable mode - that is, connected (or VC - virtual circuit) mode, where the LINK takes care of packets lost to collisions, bursts of noise, low-flying ducks, whatever. TCP is then able to deal with end to end issues, router congestion, and other such problems.

This means that AX.25 links are aggressive in the face of lossy paths (which, considering the Bit Error Rate of most ham radio links, is nearly ALL paths), and do their damndest to get the IP packets from point to point. Our network switches are hardly ever congested, so there's very little packet loss for that reason. TCP then has only to deal with the occasional dropped or missequenced packet, and the gawdawful round trip times that our miserable network makes normal.

The result is a network that works a lot better than when we were running straight datagrams all the way.

There's some strong feeling that using PPP to frame the IP going over the connected-mode links would be an improvement - the headers aren't large and would contribute little overhead, and some of the option negotiation (including compression) would be a win. It's being experimented with now and maybe we'll see some results soon.

Gary, your posts are some of the most interesting in the pile! I honestly
never thought about projection image technology. Gee, that WOULD solve the
reading bit, but...

my touch typing isn't quite that good.... :)

There is a W4 who works 40CW from his private MCI coach. He is a power plant engineer for big APU units and spends a lot of time on the road. I work him every now and then at 50WPM or so on 40CW. He uses a keyboard mounted over the top of the bus wheel. He is VERY good at it, says he is faster at night because he isn't tempted to peek at the keyboard.

One night he was in a full QSK QSO with me on 40CW and he noted, QRX ONE, PSE... There was a pause, some more CW, another pause, some more CW and so on, then he resumed fullbore....

I asked him what was going on... his answer was and I quote....

"Well, I had to leave the Interstate. I can type upside down OK, but I've never quite learned how to keep up with the keyboard when it is sideways in the middle of the turns."

yeah and at 50WPM at night.....

no foolin...

for real...

And I just THOUGHT I was a good CW op....

:)

Actually Gary, as I pointed out to Jeff in my reply to his rediculous
comment, ALOHA was developed at the U of Hawaii and first used to link
computers between the islands on a UHF link ... seems to me the first
CPUs were PDP-8s if memory serves me correctly.

Jeff either:

a) is compeletely unaware of the history of wireless digital networking,

or

b) trolling again, since HIS domain is <hawaii.edu>

I'm not sure which of the above I'd put my money on, but past history
causes me to lean towards "a" ...

Jim,

I've had good results with a Micor mobile by injecting the 9600 baud tx
into the Micor's DPL input and picking the receive directly off of the
discriminator.

Let me know if you need more detailed info.

From: Philip Rosenthal <pmr@gnn.com>
Message-ID: <32459A20.5933@gnn.com>
Source record: 34410

As noted in the title, I have put together what is possibly the smallest Packet station in the world. The problem is that the Sharp Zaurus causes my radio to break squelch the second I get the plug anywhere within an inch of the female input. I have tested movong the radion away from the immediate vicinity to no avail. When the Zaurus is on, and the plug is anywhere near the radio, I just get noise. If anyone has any sort of suggestion, I would be most appreciative. If I ever get this working, I plan to use it for emergency ARES type situations. If I somehow get my hands on a scanner, I'll even post a pic of the rig. It really is impressive. Thanks in advance for your help.

Oh! Are there any places that actually mandate AX.25 no ifs-ands-or-buts?

>Using retries at two different layers requires a layer violation to prevent
>packet storms, and neither layer violations nor packet storms are good
>things.

Which layer violation? Since this is a link thing -- ie, point-to-point,
not end-to-end -- none of the ARQ stuff should escape the channel over which
the link is running. The higher levels protocols would only "see" the
overhead on the link as a mild form of congestion, and hopefully
act accordingly.

>Now packet loss due to physical layer problems, IE weak fading channels,
>excessive multipath, etc, should be addressed at the physical layer
>by better RF path engineering and/or by better signal design.

Of course this is correct. But reality intrudes: crummy sites and/or
links are the norm, and the number of slow-speed hard-wired modems is
alarmingly large.

>>IMHO what is needed is a new link-layer that provides:
>>
>> a) items (5) and (6), given above.
>>
>> b) non-connectionless, low-overhead, frame retransmission

Duh! ^^^^ s/non-// -- brain has one idea, fingers another...

So here is a simple one:

To each packet, assign a small number. Both packet and number
are transmitted to the other end of the link. If no ack is received,
re-try. At the other end, when it gets a packet, sends back an ACK with
the number and delivers the packet to the higher level protocols.

Some measure of history will be required to prevent:

A sends packet 1
B receives, sends packet to higher protocols and acks
A misses the ack (bad receiver at A or lousy transmitter at B)
A times out, restart from the top

ie, the network downstream from B will be flooded by the re-transmissions
from A, unless B realizes what is happening.

Header overhead for something like this would be 1 byte or less. Depends
on how many un-ack'd packets one wanted to have sitting around.

>> [header]
>
>The bulk of the header overhead is in the 12 octets of physical address
>information for origninator and receipient. I don't see a realistic way
>of assigning unique physical addresses in less than 6 octets.

Six characters taken from A-Z,0-9,space can be packed into 32 bits
via a base-37 encoding. Two of those plus a PID is 9 bytes. If the
PID need only be 4 bits, and some 'restrictions' placed on the callsign,
then one can achieve an 8 byte header. No matter what the scheme, some
escape mechanism (special PID value?) could be added to cover weird callsigns.

>Indeed, the IP logical address space has recently been expanded to
>accomodate the demand for unique addresses, making the IP header longer.

Hm. I think IPv6 went totally ape with 128b addresses to solve routing and
other inter-network problems. At the link layer, however, all that is
needed is that everyone on the channel have a different physical address.
No further structure should be necessary.

>SSIDs

These can be ditched, since they are unnecessary for link purposes.
The higher-level protocols can implement them (eg, TCP port numbers).

>> [compression]
>
>I think data compression is better left to the application or presentation
>layer, but I'm willing to consider placing it lower in the hierarchy.

I thought this way as well, until I learned that the zlib can absorb a
dictionary before it begins compressing. The potential idea is that some
magic mechanism (probably a "layer violation") somewhere recognizes a
particular packet type and digs out a well-known dictionary
appropriate for it. Or, for the CPU rich, attempt compression with all
dictionaries and use the best one.

While it may be marginal gain, it would be nice to know for sure.
Without a dictionary, per packet compression is underwhelming. Just hack
a file into packet sized chunks via split(1) and "gzip -9" each one and
be disappointed, though unsurprised, at the results.

Hi!

I'm getting back on the air after a number of years of inactivity...
I would like to use one of my old HT's (a Yaesu FT-411) as the radio
for a packet station, but am in need on a power supply for it.

Years ago, there used to be a company that made a base-plate type of
contraption for HTs that one could snap the HT on to which had an A/C
power supply in it. Unfortunately, I cannot remember who made the
thing. A look through QST/73/CQ didn't turn up anything interesting.

Can anyone give me some pointers as to where I might fund such a beast
for this rig..?

Any advise/experiences would be greatly appreciated!

Please reply via email, and I will summarize to keep the bandwidth
down on the list.

regards,
David

I hear what you're saying, Brian. But ARQ is a *backup* procedure, and like any backup procedure, you hope you never need it, and do everything you can to avoid needing it. Those "aggressive" VC link retries just clog the channel. The better solution is to deal with the underlying physical layer problem.

That can take many forms. Better RF path engineering is one way. Revising the network topology so that the CS in CSMA can really work is another, IE get rid of the hidden terminals. Better signal design is another, as is use of FEC in the physical layer modem. Etc. Just hammering the channel with retries isn't a good solution. It just causes problems for everyone else.

And if you get retries on a hop, TCP will likely time out and retry too, and that'll wind up at the node doing the link level retries and be retried too, etc, until you have a packet storm on your hands. Ugly.

Now hop by hop acknowledgements have a value, if every hop is a contending one. But that's a bad network topology. A better topology has the network trunks above the LAN level be non-contending point to point links.

Hop by hop acknowledgements could have another value if they were communicated to the network as a measure of link quality, however. That way the network routers could divert packets around that faulty path and flag it for maintenence attention. (Netrom addresses this issue after a fashion.)

I realize that VC can make some systems "work", but it doesn't make them work *well*. It's like putting a bandaid over a skin cancer. It masks the problem, but it doesn't solve it. It's a kludge, and an ugly one. Mode VC retries remind me of the slogan over the workbench which reads, "Why is there never time to do the job right, but always time to do it over?"

You won't get a 'kit' but you can get a DMM module. What exactly do you
want?

> another carrier is sensed on the channel.

The attempt to emulate the CSMA/CD of Ethernet does not work very well
in practice. The CD (Collision Detect) is not even attempted due to
simplex radios. In Ethernet, the collision is immediately detected and
the random wait can start immediately. In AX.25, you have to wait for
the timeout of the missing Ack. The CS (Carrier Sense) part does not
work very well due to the hidden transmitter problem, thus, the access
control part falls apart very badly. I tried to introduce some simple
questions about the hidden transmitter problem into the Novice and
Communicator class question pool, which is under construction here in
Finland, but the questions were rejected as too complicated :-)

>2) It provides the leading flags needed to synchronize the HDLC clocks.

>3) It provides the Txd to handle transmitter and receiver settling times.

The Txd and the lack of real collision detect drastically drops the
throughput of a channel.

>4) It provides a way to avoid repeated collisions through its p-persist
> and slottime parameters.

If all stations could hear each other.

>5) It provides the hardware addresses in its header to which logical

>It does more things as well, but that's a good start. AX25 plays the
>same role over radio that MAC plays over ethernet. And for the same
>reason, because they both use shared resources.

Unfortunately the propagation medium in Ethernet is well defined but
the propagation medium in packet radio is not. Protocols that work
well in Ethernet does not necessarely do so in packet radio.

>If you are using a
>non-contending point to point link, like a leased (or dial up after
>call setup is completed) phone line, or a duplex radio link on an
>exclusive frequency, then you don't need much of a MAC layer at all.

The "X.25" part of AX.25 works well as long as the transmission medium
is similar, i.e. _full_ duplex point to point with (relatively) low
bit error rate. IMHO, AX.25 should be reserved for trunk lines.

>But if you are sharing the channel with other stations, you must
>have something like AX25 to permit it to work.

I guess that many existing networks would work as well (or as badly)
as a simple Aloha type system without any access control :-)

This is what I have seen also. On some of our longer links, we found
them
more reliable under NETROM then in DG on top of AX.25. No doubt this was
due to the 'lossy' RF network.

Well, here's my 2 cents. I purchased a DSP232 about a month ago and I love it. I've never seen anything that could dig a signal out of the noise on HF like it does. It really does a fantastic job in my opinion. Admittedly, it does have a few bugs (I have version 1.0 firmware). However, I wrote to AEA telling them my impressions, good and bad, and in less than two weeks I received a personal letter from them saying that a new (hopefully) 'bug-free' release is on the way in about thirty days. (Free of charge, of course.) They seem to really stand behind their products. As is, the DSP232 is a very good data controller. With the next release, I'm sure it will be great.

>(Netrom addresses this issue after a fashion.)

My version of the NET software measures the link quality using an
independent mechanism (periodic transmission of a sequence-numbered
datagram and bookkeeping of the missing sequence numbers to find the
percentage of successfull transmissions. It dynamically switches
between the use of UI frames and an AX.25 VC based on the outcome of
this measurement, independently for each hop in the network.

Thus, when the link works well it uses UI frames for efficiency, when
there is a high loss rate it switches back to VC to get something trough.

And yes, it detects re-transmitted TCP segments before putting them
in the VC queue, so that there won't be a TCP re-transmission queued
before the first attempt had a chance to go to the other side.
(also in the intermediate routers)

So, it IS possible to arrive at a well working compromise solution, it
just requires a bit more attention.

Rob

Hello All !

I am looking for a programmer who has the time
to continue writing a program I began working
on one year ago. The program is a JV-FAX external
driver and allows reception of NOAA-MET APT transmissions.
The program is written in Pascal and is a modifications
of the original JV-TSR.PAS sample program. I admit
the program is a bit messy since I was not planning
on making it public. However, it is readable and in a
more or less workable condition. The connection
with the JV-FAX gives a big advantage to the interface.

If there are any experienced programmers out there
that want to try to develop this program please mail me.
I can send you my interface program and some documentation
I have on Sound Blaster & DMA programming.

>(DOS) or Linux ?

It was designed to interface to the PI-2 card with a straight through
15 conductor cable in RS-422 mode. It can also support CMOS mode.

See http://hydra.carleton.ca/info/pi2.html for PI card details.

There are drivers for DOS, OS/2 and Linux.

>
>Which type does the transverter need normal type, or any specified type ?

A "normal" 10 meter IF transverter is required - same as the original modem.
Down East Microwave in Frenchtown NJ (1-908-996-3584) sells suitable transverters.

See http://www.wa4dsy.radio.org/ for more 56K modem info. The link to
this site actually uses the new 56k modems for internet access.

Hi, Brad -

The problem may be due to your new BIOS. Some of them set one of the system timers to a "wrong" value for similar software. I'm not sure if it happens with Baycom 1.5 or not, though.

There is a hamware program around by KM6PI called PMPFIX10.ZIP. It has an .EXE file as well as the C++ source code and a .DOC file. You run it before starting PMP or whatever and it resets Timer0 to mode 3 which is the "right" value.

If you can't find it, send me mail and I'll send it to you - it's about 10k uuencoded, so I don't want to post it on here (some of us pay by the byte.)

Alternatively, you can run the DEBUG script below and make your own .COM file to set the timer. Try it for a quick test if you like - even if it does solve the problem, look for KM6PI's package anyway so you can read more about it.

Cut this out, save it as an ASCII text file (not a word processor output file) named A (or whatever.) Type "DEBUG < A" without the qoutes and hit <Enter>. DEBUG will make a file called T02MODE3.COM of 24 bytes in the current directory. To set Timer0 to mode 3, run the file. Then try your Baycom 1.5 - if it works correctly, the new BIOS was the problem.

5141. BPSK modulation techniques??

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-09-24 00:00:00 UTC
From: anilsson@tartarus.uwa.edu.au
Message-ID: <528998$gsn@enyo.uwa.edu.au>
Source record: 34436

I was wondering if someone can provide me with pointers(or actual info) on
how to generate a BPSK signal at VHF frequencies at reasonably datarates.
The proposed frequency is about 131--132Mhz and datarates 19k2 upwards
(probably more upwards than 19k2).
(Ok I know generating BPSK is trivial but I would like to have a look at
few circuits which other people are using.)

Basically I want to feed this into a 1296 transvertor so it comes out
around 1284Mhz. This is very similar to the RUDAK user terminal suggested
before RUDAK on AO13 died except for the higher data rates.

Thanks in advance...

Andrew VK6JBL

Here in Ct we've tried VC on link circuits where there are no 'users' to speak of and the RF path was marginal. It helped, once in a while as long as there was no serious volume of traffic. As soon as the traffic volume came up, the link just beat itself to death. There is no substitute for having a physical layer that works.

>
>Jeff KH2PZ / KH6

Well, lets see. The propagation time is roughly 3000/186000 or
About 16 milliseconds. That's how long it'll take for the message
to start reaching the destination. The time it'll take to arrive
completely depends on the length of the message.

So how long is the message? If it is 120 words (PARIS standard),
then on a good channel it'll take about a minute. On a heavily
contending channel, it would take longer, all the way up to link
failure due to congestive collapse, since you're basically operating
pure ALOHA on HF. But if we assume we're at maximum ALOHA capacity
on the channel, IE roughly 20% that of a non-contending channel,
it'll take about 5 minutes. We can stay near the ALOHA limit by
proper use of the p-persist and slottime parameters (if everybody
on channel plays nice).

Note, the propagation gods have to be smiling, of course. If there is no direct path open between the two coasts, the packet station may have to depend on an alternative routing via a series of relays over which there is a path. This can add from a few minutes to a few hours to the message delivery time. There's a station in Panama operating 7x24 which is often used for relay when there's no East-West path, because the North-South path is usually still open to either coast from Panama.

But Morse can do no better. Even when the NTS was fully staffed by Morse operators meeting a full schedule of traffic nets, several hours were often required to relay a message from coast to coast.

If you'll accept a different digital mode than packet, say PACTOR II, then your 120 words are delivered in about 6.4 seconds on a good channel (Clover performance is about the same), and in about 8 minutes on a channel so bad you'll give up with OOK Morse. Fast enough for you?

Now, how long will it take you to pass that same 120 word message, error free, beeping it out in Morse? On a very good channel? On a channel so bad you can't reliably pick the carrier out of the noise by ear? When there's no path at all and you have to find a relay station?

Keep in mind that for virtually any channel where OOK Morse is usable at 20 WPM, AMTOR is usable at 60 WPM, PACTOR is usable at approximately 100 WPM, and Clover and PACTOR II are usable at approximately 470 WPM (or better). On really bad channels, where OOK Morse speeds drop to 1 or 2 WPM net with *very* good operators, AMTOR and PACTOR pretty much fall apart completely, Clover starts to stumble, but PACTOR II is still hammering along at about 15 WPM net, error free.

And theory says we can beat PACTOR II performance by about 4x if we use a proper coherent I/Q receiver instead of just a digital back end to an analog superhet receiver as we do it today, IE we can get back to 60 WPM on a channel that only supports 15 WPM PACTOR II now, or 1 to 2 WPM Morse now. Or conversely, we can work at signal levels 4x less than today while maintaining the same throughput (that puts manual OOK Morse completely out of the running). And as I noted in another message, such a receiver is rapidly becoming within amateur reach.

The LOWFERs have a coherent digital system, detailed in Vol 1 Issue 1 of Communications Quarterly, which can reliably work 1,000 miles *groundwave* (day or night) on the 1750m band with an ERP of under 10 *milliwatts*. That's the current "amateur" state of the art in digital weak signal performance.

The VLF path loss is as severe as EME operators have to contend with (though the fading characteristics are different), and EMEers need well over 1 kW ERP to make contacts using OOK Morse. That's some 40 db more signal required for manual Morse versus a machine digital

method built by "amateurs" who aren't necessarily even licensed hams.
And their system doesn't even use a modern DSP processor or any FEC.
That's *raw* performance from their RF modems. We can do better.

Gary

> the underlying physical layer problem.

Yes. ARQ is indeed a stopgap.

ARQ is good at taking a low error rate and making it essentially zero.
But it's terrible at high error rates. A much better approach is to
add forward error correction at the physical layer that reduces the
error rate to where ARQ can operate efficiently.

Depending on the FEC code chosen, during normal operation there may
be some residual errors. Or the decoder may produce either perfect
data or nothing at all if the channel is blocked or broken.

An example of the former is a Viterbi-decoded
convolutional code by itself, and examples of the latter are
sequentially decoded convolutional codes with long
constraint lengths, and concatenated Reed-Solomon/Viterbi
combinations. Depending on the channel characteristics you may or
may still want an ARQ protocol at the link layer to
mop up the residual errors, but this is decidedly optional; as long
as the error rate is low enough for TCP to perform well, there's
no need to make it zero.

As an aside, a concatenated RS/Viterbi decoder is used in DSS
(DirecTV/USSB). That's why the system usually works perfectly or
not at all. If you slowly move your hand in front of the feed,
the picture tends to remain perfect until it suddenly freezes. That's
because the BER curve of the concatenated code is extremely steep.
This is characteristic of all strong codes.

Phil

All,

I am looking for transverters in general, but primarily at 220mhz trasverters. A company called Microwave Modules made some a few years back. I have a 440mhz version and would like to find some working one. Again, I am looking for all freqs with a focus on 220mhz. Please email to ne1h@ne1h.radio.org or reply to this posting. There may be others that will work the requirement is 10mtrs/220mhz or 10mtrs/other freqs. I need the downcovert side to be 10mtrs.

Thanks,
Alan K. Adamson

Except when there are several stations on the same channel using the
same callsign.

> >> [compression]
> >
> >I think data compression is better left to the application or presentation
> >layer, but I'm willing to consider placing it lower in the hierarchy.

Experience with GZIP at the application layer vs Stac and other schemes
above PPP show
that compression really does belong at the application layer, at least
when the application
is a long stream. Application layer compression is now so common as to
make link layer
compression almost superfluous. Images are almost always compressed at
the application layer
with GIF or JPEG, and large files and archives are almost always
compressed with gzip
and pkzip or equivalent. And interactive streams are now easily
compressed on the fly
with ssh -C (just turn off the encryption if you're operating over a ham
radio link).

> Andrew VK6JBL

One simple way to generate BPSK is to use a double balanced diode mixer (Mini Circuits is one good supplier). Drive the IF port with the modulation signal, connect the RF port to input signal, and connect the LO port to the output.

You will need a mixer that the frequency range of the IF port includes DC -- which many do. A positive polarity applied to the IF port yields one phase and a negative polarity yields the other phase. Also, because you are biasing the internal diodes with the modulation, remember to current limit the modulation signal to a few milliamperes.

If you stare at the schematic of the mixer, you will convince yourself that when a positive polarity signal is applied to the IF port, the two transformers are connected together with one phasing; and, when a negative polarity signal is applied to the IF port, the two transformers are connected with the opposite phasing, thus the 180 degree phase shift.

I've used this technique for modulation up into the microwave frequencies. Remember to band pass filter the output signal, it has a very wide bandwidth.

Yeah, that's why they developed it, they needed a way for the students
and faculty on the other islands to use the computer on Oahu. (I think
Gary's wrong here, and ARPA had nothing to do with it -- UofH built it
because they *needed* it.)

> Not interested at all. What interests me are HF modes in which real-
> time two-way communications can take place.

Anybody know what frequencies the original AlohaNet used? I had
a copy of the paper, but I don't seem to be able to find it.
[Abramson, N. The Aloha system. AFIPS Conf. Proc., Vol. 37, 1970
FJCC, AFIPS Press, Montvale, NJ, pp. 281-285.]
AlohaNet certainly did real-time two-way communications, and I wonder
if they used HF? I don't believe all the Hawaiian islands are
line of sight from each other.

Message-ID: <199609251009.MAA19261@cinema.iag.tno.nl>
Source record: 34351

The Netherlands, September 25, 1996.
Hello dear reader,

NET/Mac v2.3.61 was born...

For those who don't know NET/Mac... NET/Mac is the application that
supports TCP/IP over packet-radio, which means, that hamradio operators
can use NET/Mac for their wireless TCP/IP network...

In this version of NET/Mac the following mods/features were implemented:

- Fixes for AddResMenu() bug in System 7.5.4
- Fixes for AddResMenu() bug in System 7.5.5 and higher
- Modified some Copyright notices

- NET/Mac does NOT support the new Buckmaster CD-ROM's HAMCALL
database yet... I am trying to convince Buckmaster that I need
the new data-encryption-method, but as of yet they are not ready
to release a description of the encoding-algorithm...
The old CD-ROM's remain fully supported...

This version obsoletes all versions of info-mac/comm/radio-net-mac in
the Sumex-Aim.stanford.edu (and it's mirror-) archives.

It also replaces /pub/mac/_communicatie/_internet/radio_net_mac_23xx.hqx
on ftp.idg.nl.

The new NET/Mac has (hopefully) been uploaded to:

- oak.oakland.edu, to the directory /pub/hamradio/mac/digital
- ftp.ucsd.edu, to directory /hamradio/packet/tcpip/incoming.
If it's not there (anymore), then look at /hamradio/packet/tcpip/mac.
- hamster.business.uwo.ca, to directory /pub/amsoft
- wa2zkd mirrors UCSD's incoming on his Landline BBS. Ham's w/o ftp
can call 716-544-1863 or 2645.

NET/Mac will be uploaded to PI1HVH.AMPR.ORG, directory public/mac.

If I read you correctly, you're not interested in making informed
comments about packet radio. Therefore, it probably is a waste of
time to even try to have a discussion with you. However, packet is
a perfectly viable mode for real-time two-way communications - I've
done it several times myself.

>What's the average delivery time for a packet message to go from
>originator to addressee, say between the East and West Coasts?

I dunno. I know that when I connect to the East coast from the West
coast on packet, there's no more delay than when I work the East
coast on CW, which is an apples to apples comparison. How long does
it take the automated CW nets to send messages? ;-)

Never mind, since you're not interested in making informed comments
on the topic.

From: dabo@flash.net
Message-ID: <52bgbr$2er@dfw-ixnews6.ix.netcom.com>
Source record: 34358

I am attempting to receive EMWIN signals from a transmitter site in McAlister, OK, using an MFJ-1278 multi-mode data controller. Does anyone know how to configure this unit to demod the constant datastream from an EMWIN broadcast?

Also, if anyone knows of an alternative demodulator (cheap, or homebrew plans are preferable) that will demod the EMWIN signals, please help. I am very interested in getting this data for local SKYWARN use!

Thanks!

Hm. Another argument for not encoding the callsign as the link address.
Perhaps a scheme that dynamically assigns these addresses, or more simply
an IPv4 address of the interface without the "44.".

Gosh. Are there similar restrictions on developing and fielding possible
improvements in the commercial arena? [Just curious;

>There is no need to save on address header length, this is not where
>efficiency or link throughput is lost. At least not at reasonable bitrates.

Well, I guess I have to ask: what is "reasonable"?

>When a new link layer addressing scheme is devised, PLEASE DON'T MAKE THE
>SAME MISTAKE OF "ANY AMATEUR CALLSIGN IS 6 ALPHANUMERIC CHARACTERS OR LESS"
>AGAIN!

This is an argument for tossing the idea of encoding a callsign into
every single packet that gets transmitted. Somehow assign a "unique"
random bit string as the address to each station and use that
instead. Identification is via an frame which makes the connection
between this bit string and the complete callsign, however long it may be.

5166. How to add a DIN plug to my KR-5600 ?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-09-25 00:00:00 UTC
From: ferracci@imaginet.fr
Message-ID: <32494c01.2857325@news.imaginet.fr>
Source record: 34362
Cross-posted to: rec.radio.amateur.digital.misc,uk.radio.amateur

Hi,

I've recently purchased a TrakBox kit from TAPR.
The kit itself is perfect, the TrakBox seems to be a wonderful thing.

I've build it, and i'm now "building" the box. This is probably the hardest part of the kit, as digital electronic itself was "plug'n play" !

I met a problem: My rotor controler (Kenpro KR-5600) is a little bit too old, and it does not have any DIN connector. So i can't plug the TrakBox directly to the rotor controler.

I guess that it is possible to add the DIN connector myself... But i don't have the schematics !

So, my question is: Has someone of you successfully done that modification to a KR5600 ?
If so, could you please help me ?

Other question: Can someone who has a scanner and the schematics of a KR-5600 with DIN connector scan it and Email it to me ?

Thanks a lot. If i get some interesting replies, i will compile them and make a nice "how-to" file.

Source record: 34363

Hello All,

I wonder if someone might be able to help.

I've just started writing a Macintosh SSTV programme
which uses the sound input and outputs.

What I'm looking for is a few pointers / info on the
various modes and also on how best to do the data
to pixel conversion ie do I need to use a FFT of some sort.

Thanks in advance for any help.

Kind regards,

Sean.

>This is characteristic of all strong codes.

Yes, that's absolutely right, Phil. But the *first* line of attack
should be even more basic. The RF links should be engineered
with adequate fade margin. The topology of the network should avoid
hidden or exposed terminals. And the basic signal design should
be robust. If you do those things right, you shouldn't need

a particularly strong FEC (with its necessarily high overhead),
and you shouldn't need many ARQ repeats (with their even worse
congestive effect on the network).

Packet operators tend to overlook the basics because the protocols
bandaid the shortcomings of their links. We need to emphasize to
people the importance of getting back to the basics with their
network links. Packeteers shouldn't usually be using VHF/UHF RF
links that they would find unacceptable if they were using them to
link voice repeaters. Just because they can bandaid them with protocol
overhead doesn't mean that they should.

They should reserve those techniques for situations, like the radar
interference you face, or the power limited cases satellite operators
face, where they cannot realistically engineer around them in other more
basic ways. Packet is intended to allow a channel to be shared with many
users, but it is not intended to be a way to compensate for poor RF
engineering.

I recognize that there may be a tradeoff here between FEC and more
traditional RF path engineering. In some cases, FEC allows us to
"short space" links which would normally require enough power to
mutually interfere if we didn't use FEC. So FEC can be a useful
network topology enhancing tool. But we should opt to use it wisely,
understanding *why* we're using it in a particular case, and not as
just an excuse to avoid doing the proper system RF engineering in
the first place.

From: Greg Corteville <cortevi5@pilot.msu.edu>
Message-ID: <32496CAF.1CF6@pilot.msu.edu>
Source record: 34367

I set Linux up with our club's AEA-232. I'm trying to get axspawn to work so we can log into the system over packet. The system will transmit and receive short packets fine. But when the Linux system starts to send something long, I get this in the syslog:

Sep 25 13:05:34 msuarc kernel: sl0: truncating oversized transmit packet!
Sep 25 13:06:06 msuarc last message repeated 14 times

and the TNCs will constantly transmit and receive bad packets until I break the connection. I'm assuming this has something to do with Paclen? Which one should I change? The one on the TNC or in the axports file? They're both set at 128.

Hello, Folks:

I now have Packet Bulletin Export Files available on my Home Page.

The files are split by distribution group. I now have the following available: ALLUSA, WW, EU, CANADA, ARRL, AMSAT, and NASA. Others may be added as needed.

Files will be posted daily and should be online after about Noon Central Time.

Just point your Netscape 3.0 or MS Inetrnet Explorer 3.0 browser at:

http://www.trucom.com/ppages/marty

and go to the Amateur Radio area. The rest should be clear to all.

NOTE: New export files by distribution are being added almost daily! Many thanks to all who are sending me their BBS exprts via attached E-Mail for inclusion!

Take Care & 73

Subject: APT+JVFAX+SOUNDCARD

Hello All !

I am looking for a programmer who has the time
to continue writing a program I began working
on one year ago. The program is a JV-FAX external
driver and allows reception of NOAA-MET APT transmissions.
The program is written in Pascal and is a modifications
of the original JV-TSR.PAS sample program. I admit
the program is a bit messy since I was not planning
on making it public. However, it is readable and in a
more or less workable condition. The connection
with the JV-FAX gives a big advantage to the interface.

If there are any experienced programmers out there
that want to try to develop this program please mail me.
I can send you my interface program and some documentation
I have on Sound Blaster & DMA programming.

That's a hoot. Norman Abramson at the University of Hawaii (ever
heard of that place?) developed something called ALOHA in the 1970s,
which really was the original packet radio network.

If you're interested in making informed comments on the topic,
I suspect your library at the school there has plenty of info,
probably even all of the papers that were published.

Not interested at all. What interests me are HF modes in which real-
time two-way communications can take place.

What's the average delivery time for a packet message to go from
originator to addressee, say between the East and West Coasts?

Hi, Brad -

The problem may be due to your new BIOS. Some of them set one of the system
timers to a "wrong" value for similar software. I'm not sure if it happens
with Baycom 1.5 or not, though.

There is a hamware program around by KM6PI called PMPFIX10.ZIP. It has an
.EXE file as well as the C++ source code and a .DOC file. You run it before
starting PMP or whatever and it resets Timer0 to mode 3 which is the "right"
value.

If you can't find it, send me mail and I'll send it to you - it's about 10k
uuencoded, so I don't want to post it on here (some of us pay by the byte.)

Alternatively, you can run the DEBUG script below and make your own .COM
file to set the timer. Try it for a quick test if you like - even if it
does solve the problem, look for KM6PI's package anyway so you can read more
about it.

Cut this out, save it as an ASCII text file (not a word processor output
file) named A (or whatever.) Type "DEBUG < A" without the qoutes and hit
<Enter>. DEBUG will make a file called T02MODE3.COM of 24 bytes in the
current directory. To set Timer0 to mode 3, run the file. Then try your
Baycom 1.5 - if it works correctly, the new BIOS was the problem.

---------- cut here ----------
a 0100

```
MOV AL,EE
OUT 43,AL
IN AL,40
AND AL,0E
CMP AL,06
JZ 0116
MOV AL,36
OUT 43,AL
XOR AL,AL
OUT 40,AL
OUT 40,AL
INT 20

n t02mode3.com
rcx
18
w
q
----------------------- cut here -------------------------
```

BTW, I post this on here because it seems to me I've read some similar request for help recently. Maybe someone else can use the info. And, I post it as a DEBUG script so you can analyze the code before you try it and see that it's not going to send your new computer into orbit ;-).

Good luck and 73 -

From: anilsson@tartarus.uwa.edu.au (Andrew Gareth Nilsson)
Subject: BPSK modulation techniques??

I was wondering if someone can provide me with pointers(or actual info) on how to generate a BPSK signal at VHF frequencies at reasonably datarates. The proposed frequency is about 131--132Mhz and datarates 19k2 upwards (probably more upwards than 19k2).
(Ok I know generating BPSK is trivial but I would like to have a look at few circuits which other people are using.)

Basically I want to feed this into a 1296 transvertor so it comes out around 1284Mhz. This is very similar to the RUDAK user terminal suggested before RUDAK on AO13 died except for the higher data rates.

Thanks in advance...

This is what I have seen also. On some of our longer links, we found
them
more reliable under NETROM then in DG on top of AX.25. No doubt this was
due to the 'lossy' RF network.

>however. That way the network routers could divert packets
>around that faulty path and flag it for maintenence attention.
>(Netrom addresses this issue after a fashion.)

My version of the NET software measures the link quality using an
independent mechanism (periodic transmission of a sequence-numbered
datagram and bookkeeping of the missing sequence numbers to find the
percentage of successfull transmissions. It dynamically switches
between the use of UI frames and an AX.25 VC based on the outcome of
this measurement, independently for each hop in the network.

Thus, when the link works well it uses UI frames for efficiency, when
there is a high loss rate it switches back to VC to get something trough.

And yes, it detects re-transmitted TCP segments before putting them
in the VC queue, so that there won't be a TCP re-transmission queued
before the first attempt had a chance to go to the other side.
(also in the intermediate routers)

So, it IS possible to arrive at a well working compromise solution, it
just requires a bit more attention.

and over and over and over and over...

Here in Ct we've tried VC on link circuits where there are no 'users' to speak
of and the RF path was marginal. It helped, once in a while as long as there was
no serious volume of traffic. As soon as the traffic volume came up, the link
just beat itself to death. There is no substitute for having a physical layer
that works.

Well, here's my 2 cents. I purchased a DSP232 about a month ago and I
love it. I've never seen anything that could dig a signal out of the
noise on HF like it does. It really does a fantastic job in my
opinion. Admittedly, it does have a few bugs (I have version 1.0
firmware). However, I wrote to AEA telling them my impressions, good
and bad, and in less than two weeks I received a personal letter from
them saying that a new (hopefully) 'bug-free' release is on the way in
about thirty days. (Free of charge, of course.) They seem to really
stand behind their products. As is, the DSP232 is a very good data
controller. With the next release, I'm sure it will be great.

>(DOS) or Linux ?

It was designed to interface to the PI-2 card with a straight through
15 conductor cable in RS-422 mode. It can also support CMOS mode.

See http://hydra.carleton.ca/info/pi2.html for PI card details.

There are drivers for DOS, OS/2 and Linux.

>
>Which type does the transverter need normal type, or any specified type ?

A "normal" 10 meter IF transverter is required - same as the original modem.
Down East Microwave in Frenchtown NJ (1-908-996-3584) sells suitable transverters.

See http://www.wa4dsy.radio.org/ for more 56K modem info. The link to
this site actually uses the new 56k modems for internet access.

I have a PK232MBX and I run a lot of RTTY, pactor, and amtor. I'm looking for a good windows based front end for it. Something like PakRat for Windows, but I want something pd or shareware so that I can try it out first and see if I like it. The author of KaGold told me awhile ago that we was going to add support for the PK232, but I don't know what the status is on that.

Thanks,
Kory

Wrong. If you want a copied disk, you have to pay for it. If
you copy it yourself, it's free.
BTW the newest version runs on top of the PC/FlexNet kernel.
It can be downloaded from http://home.pages.de

Source record: 34377

Hi u all out there, I also put this letter - tranlated to English - into a U.S. newsgroup, 'cause I am afraid, HAM's here in Germany/Austria aren't able to answer me the following questions:

How can i connect my Packet radio PC (running under WIN95, Linux also possible) at home to the Internet PC (WIN95 Client to the University novell server) at my university? I'm working in the university of Innsbruck, i have there my own PC, my own IP adress and my PC there is online 24 hours a day: what is my greatest desire: connecting my home PC to the Internet PC at my university office: only about 3 miles apart! Phone costs are too much, i do not want to pay any longer to our telecom so high phone bills (about 350 $ per month only for being connected sometimes to my office PC !!!!), only for being connected to my office internet pc via a normal tcp/ip phone line! I am a radioamateur, why not use the resources I'm allowed to do? The problem is, i do not have so much time, so i am interested in experienced and ready solutions, so please tell me:

for the 3 miles connection Internet PC (TCP/IP only)
<-> Packet Radio PC (AX.25, TCP/IP ?) what do i need ??

A) Hardware: for a connection with a minimum of about 14400 bps, what u think is better: 2m or 70 cm or something else? A monoband or duoband (2m/70cm)?
Which 2 modems should i use/buy(where/how to get it- Austria is not a good place for buying good modems) ?

B) Which Software should i use, i heard about NOS or something like that, should i do it with dos, windows(3.x, NT or WIN95 ?) or even Linux, where can i get the newest versions, documentations, with which modems does this software cooperate etc etc ??
Remember, i'm not so experienced, so i can install a programm that can run without great problems, but i'm not the typical "Linux Hacker" that i can do all by myself (if so i probably had already my own gateway :))!

You know, for a beginner it's very hard to get
acquainted with all that stuff, it's very hard to surf through all the packet pages, but nowhere i could find right answers to my questions, but i think there somewhere somebody, who already got the solution for my problem and can help me in making an Internet Gateway for PR, and this twice (at home and my office in University)

So then, you would make me very very happy, if u could give some good tips, thanks alot for reading this long message

Yes. Some European nations require it, and I think Australia requires
it.

>>Using retries at two different layers requires a layer violation to prevent
>>packet storms, and neither layer violations nor packet storms are good
>>things.
>
>Which layer violation? Since this is a link thing -- ie, point-to-point,
>not end-to-end -- none of the ARQ stuff should escape the channel over which
>the link is running. The higher levels protocols would only "see" the
>overhead on the link as a mild form of congestion, and hopefully
>act accordingly.

You can still get packet storms if the link backs up and the higher
level starts sending retries, which get queued behind the first packet
at the link with the faulty path. Even after the path reopens and the
first frame gets through the faulty link and is acknowledged, all the
other retries are still in the link's queue, so they get sent too, and
acks come back from the other end for each of them too. That's a packet
storm. This was particularly bad before TCP went to exponential
back-off.

To avoid this, you need to have a layer violation at the link layer
which recognizes duplicates from the higher layer and deletes them.
This is a layer violation because the higher layer may be sending
the duplicate for a good reason unrelated to link failure. This can
trash a layer 4 connection.

At layer 3 and below, you really want the layers to be stateless
and totally uncaring of the content of the higher layer frames
which they are relaying.

>>Now packet loss due to physical layer problems, IE weak fading channels,
>>excessive multipath, etc, should be addressed at the physical layer

And they'll *stay* that way as long as you can kludge a way to make
them sort of work.

>>SSIDs
>
>These can be ditched, since they are unnecessary for link purposes.
>The higher-level protocols can implement them (eg, TCP port numbers).

Nope, no way. You have to be able to separate the physical addresses
of stations with the same call sign on the same channel. This is very
common. Many amateurs have more than one station.

>>> [compression]
>>
>>I think data compression is better left to the application or presentation

>magic mechanism (probably a "layer violation") somewhere recognizes a
>particular packet type and digs out a well-known dictionary
>appropriate for it. Or, for the CPU rich, attempt compression with all
>dictionaries and use the best one.

The real problem is that *each* link has to decompress *each* packet
to determine if it is the addressee. If it is, it then has to do
whatever processing required then *recompress* it before relay. That's
very inefficient and CPU intensive. And since the link is not loss free,
compression methods that work on streams will fail due to missing segments
or duplicated segments received. The overhead to keep all this straight
is as bad as the ordinary overhead up through layer 4, so there's no
need to duplicate that just so you can do compression at the bottom
layer. Do it above layer 4 where the data stream is guaranteed to be
complete and in order, and you only have to do it once for the source
and only have to do decompression once at the destination, not at
every intermediate link.

The KS900 works fine as is, though you might want to snip out one
capacitor to shorten Txd. The KS960 needs reworked filtering, so it
may be worthwhile to buy it with that already done.

I'd just buy the KS900 direct from TEKK and save the bucks.
The KS960 is *not* an improvement for our purposes.

>Communicator class question pool, which is under construction here in
>Finland, but the questions were rejected as too complicated :-)

The CS part works just fine if you deal with the hidden transmitter
problem, *which you should*. The easiest topology to do that is a
digital repeater for the LAN. CD will even work if the users are
duplex too, though that isn't the usual case. CD is nice, but it
isn't nearly as important as CS. And you can make CS work. Trunks
between LANs should be engineered to be non-contending, so the
problem doesn't even arise there.

>>2) It provides the leading flags needed to synchronize the HDLC clocks.
>
>>3) It provides the Txd to handle transmitter and receiver settling times.
>
>The Txd and the lack of real collision detect drastically drops the
>throughput of a channel.

Txd and flags are needed on any shared channel. There's no way to keep
the HDLC clocks of a group of stations synchronized to each other tightly
enough to not require a burst of flags at the start of a particular
station's transmission to regain synchronization at the receiving station.
And on any shared channel, transmitters have to be turned on and off in
order to allow other stations to use the channel. That implies a settling
time at key up which the protocol must allow for by delaying start of
data transmission. CD is not essential if the network properly allows
CS. The window of vulnerability to collisions is narrowed dramatically
in a properly engineered network which allows CS to work, and which

employ's the p-persist mechanism to reduce to negligible the chance
of repeated collisions in those relatively rare cases where two stations
key up at exactly the same time.

>>4) It provides a way to avoid repeated collisions through its p-persist
>> and slottime parameters.
>
>If all stations could hear each other.

If they can't, *FIX THE PROBLEM*! If you have an RF problem, fix *IT*!
Don't go off and fix something else which isn't broken. The packet
protocol is intended to allow sharing of an RF channel, but it is
not intended to compensate for poor RF path engineering.

If you have a hidden transmitter on your LAN, find the offending HT,
take it to a crossroads at midnight, and drive a wooden stake through
its black heart.

Or alternatively, if you can't rid the channel of idiots inappropriately
trying to use HTs for packet, then install a digital repeater so that
they *can* be heard by all the other stations on the LAN anyway.

This is an RF engineering issue, no different from the one voice users
face, and the proper way to solve it is the same way voice users do.
If you must run simplex, require stations to be adequate to actually
be heard by all the other stations. Otherwise, put in a repeater so that
they can be heard anyway. It's that simple.

Source record: 34300

Hello...
I've just updated by FTV program, which does FAX & SSTV using a SoundCard, to decode Baudot using the same (FM) demodulation engine.

Here is a run down of the more interesting features:

(1) It keeps the demodulated signal in memory, so that the signal can be analysed again at a different keying rate or polarity! Garbage can be resampled on the fly, which means that minutes of received signals decoded at the wrong baud rate or keying polarity are recovered, on the fly, while still receiving.

(2) Keying rate and polarity are analysed automatically - standard baud rates are automatically set following analysis.

(3) Tuning oscilloscope available at all times, without loss of copy.

(4) Program works in real time.

(5) I wrote it, and I love it - I myself can't believe it works so well!

Take a look at my web site for futher details, at:
http://www.geocities.com/SiliconValley/2504

I also intend to add a new demodulator, using a coarse FFT, for better performance, and perhaps, a Morse code decoder, but that's something for later...

What can I say? Try it, and may you have as much fun as I am having...
And, keep me posted...

Source record: 34388

Hi. I've just released the Reed-Solomon software I've been working on lately.

The software can encode and decode Reed-Solomon codes with symbol sizes ranging from 2^2 to 2^16 bits. The default parameters are for the (255,223) code with 8-bit symbols that was used on the Voyager-2 spacecraft at Uranus and Neptune.

The files are as follows:

http://www.qualcomm.com/people/pkarn/feccode/rs-readme
http://www.qualcomm.com/people/pkarn/feccode/rs.zip
http://www.qualcomm.com/people/pkarn/feccode/rs.tar.gz

I've also updated my ham radio digital communications page (http://www.qualcomm.com/people/pkarn/ham.html) with pointers to these files. Enjoy!

Phil

Gary, you're quite right that improving the RF hardware will always help. That's so obvious I didn't even think it worth stating. :-)

More seriously, as nice as it would be to engineer good links, this just isn't always possible due to cost constraints, lack of good sites, zoning and deed restrictions, etc. So there's room for improvement at multiple levels; hopefully the sum of these improvements will be worthwhile.

You mention "fade margin". In the presence of relatively fast fading, i.e., fade intervals on the order of a transmission time, coding can be of even greater benefit than on a non-fading channel. Some numbers: a typical coding gain on an additive white gaussian noise (AWGN) channel (e.g., a satellite or deep space link) is maybe 5-7 dB. But on a Rayleigh fading channel, coding with sufficient interleaving can produce power gains of 30-40 dB, depending on the desired error rate (the lower the desired error rate, the bigger the gain of coding).

Rayleigh fading describes many real-world channels, including mobile radio, HF and EME. Of course, if the fade rate is too slow to cover with interleaving, coding won't be able to ride across the gaps. But in the vast majority of cases, interleaver spans that correspond to typical packet sizes are long enough to give significant benefit.

You also mention "overhead", an often pejorative term. Yes, the redundancy added by coding is "overhead" in the sense that it doesn't carry additional user data, but the payback is often in being able to run *more* user data than you could without the overhead, which means you still end up well ahead. Coding (of which spread spectrum can be seen as a special form) not only lets you use less transmitter power to achieve a given user data rate, but that lower transmitter power means less QRM to other users, and you are in turn more tolerant of QRM from other users. This is why coded spread spectrum systems are

the technologies of choice for commercial and military packet radio networks where it is no more practical to eliminate hidden terminals and put up big antennas than it is in the amateur service.

Dan,

There's another interesting way to demodulate FSK, as long as it's *continuous phase* (no sudden phase jumps between symbols).

See "The Viterbi Algorithm" by G. David Forney, Proceedings of the IEEE, March 1973, p. 268. This is a tutorial on the Viterbi algorithm that had been invented six years earlier as a way to decode convolutional codes, but turns out to have many other uses as well, such as decoding FSK, dealing with intersymbol interference, and recognizing text.

Forney claims that Viterbi decoding of phase-continuous FSK that takes into account the "memory" of the modulator performs 3 dB better than the best you can do with coherent detection over only one symbol interval, and as good as coherent detection of antipodal BPSK.

I believe Dave Mills, W3HCF, has implemented something like this for the TAPR DSP-93 box.

> (also in the intermediate routers)

As "layering violations" go, this one is actually a fairly good idea.

Earlier this year I came up with another one that's similar. The problem I was concerned with is the congestion caused by TCP ACKs when streaming data at high speed over an asymmetric path (e.g., a cable modem). My solution is to implement mechanisms at the bottleneck router that drop duplicate acknowledgements when they're superseded by more recent ones. That is, when you're about to queue a new packet on a link and there's an older one for the same connection already in the queue, look at the older one to see if it carries any data or flags. If not, replace it with the newer packet. Since TCP acks are cumulative, the new packet can replace the older one.

I'd like to see more simulations of both ideas, but right now they seem pretty benign and workable. Both our "layer violations" consist of occasionally dropping a packet, something the Internet already does on its own so TCP is designed to deal with it. The important thing is that the packet is not *modified* in any way that might spoil the end-to-end integrity check.

> frames. It isn't just for weak signal use.

Right. Some of the original research into coding was inspired by QRM from Navy shipboard radars. Because of the short duty cycle of the typical radar pulse, coding can be especially effective against it. This should interest us, given that just about all amateur spectrum above 222 MHz is shared with military radar.

> I agree with this as well. My plaint about overhead was about

> level 1, the less overhead we need to deal with impairments.
> Obviously, if impairments are still a major consideration when
> we've engineered the RF as well as we can in the traditional ways,
> then the overhead is no longer unnecessary.

I too used to believe that FEC was something you did when you couldn't make the link work without it, but I've changed my opinion on this. It belongs in *every* modern physical layer, because it always helps reduce RF power, increase user data rate and interference immunity. The only good reason for not using it in the past was the CPU intensity of decoding it, but today that's no longer a problem.

> I would caution that our amateur networks are often sparse.
> That leads to different tradeoffs in network topology than
> for a dense network where a SS microcellular approach might be
> better. Sometimes a beam pointed at a distant digital repeater
> is the right answer.

This is true, but it still calls for proper physical layer engineering in which coding plays an important part. BTW, ARQ can also be seen as a form of coding. The CRC is a high rate block code. The minimum hamming distance between valid codewords is too small to support error correction,

so "adaptive repetition coding" (i.e., retransmission of the same
packet)
is used. This works reasonably well at high SNR, but falls apart at
lower
SNR because the code just isn't well adapted to the channel.

Phil

5203. Need info on PacComm Tiny-2

Hello,

SM7UGE calling.... I have tested Ethrax25 (v1.04 - released 23
september) and Trumpet Winsock in the air towards a JNOS-station.
POP3, FTP and NNTP works just fine. BUT there is one small problem -
for example if I start Eudora and run a POP-session - it is very
slow.... If I start WS_FTP and run a FTP-sessio - it is very slow....
BUT if I run POP and FTP at the same time - it works very FAST!

So, it seems like if both ends have very "little" to do, it works
very slow, and if both ends have "alot" to do - it works very
fast....! Could it be some cind of a buffer that has to be filled
before the application transmitts ? What is this buffer in that case?
Or what is "wrong" otherwise....?!

Unfortunately, I believe that it is worth stating. Many packeteers
do seem to ignore the realities of level 1, expecting that the
"magic" of the packet protocol will fix any problems. As you note so
well below, level 1 coding magic can fix a lot of problems, but that
isn't the sort of thing the naive packeteer means. He expects level 2
ARQ to fix the problem. We both know that level 2 can sometimes make a
channel work for a user, but the cost is often reduced throughput
for everyone else sharing the channel.

>More seriously, as nice as it would be to engineer good links, this

Sure. I agree that the problem should be addressed on all levels.
It is vital to consider the entire operation on a systemic basis.
Otherwise, some change we make in one part of the system may have
adverse effects on other parts of the system. The classic example
of that used to be the packeteer who put a big amplifier on his
station so that his throughput would improve. He didn't consider
the system, or the effect his big amp might have on users two
counties over. Today it is more often the packeteer who thinks
he can use his rubber ducky equipped HT to access a simplex LAN,
nevermind that he becomes a hidden terminal to 99% of the participating
stations and damages the aggregate throughput of the LAN in the
process. The whole network is a system, and must be treated that
way.

I'm with you on this, and I might add that such coding is just as
effective against noise pulses and interference which puncture packet
frames. It isn't just for weak signal use.

>You also mention "overhead", an often pejorative term. Yes, the

>the technologies of choice for commercial and military packet radio
>networks where it is no more practical to eliminate hidden terminals
>and put up big antennas than it is in the amateur service.

I agree with this as well. My plaint about overhead was about
unecessary overhead. The better we can engineer the underlying
level 1, the less overhead we need to deal with impairments.
Obviously, if impairments are still a major consideration when
we've engineered the RF as well as we can in the traditional ways,
then the overhead is no longer unnecessary.

I see you are taking that a step further and advocating coding
as a primary level 1 engineering tool. One that lets us trade
off traditional level 1 RF engineering measures against coding
overhead. That offers us another way to map the topology of the
network, and may allow us to pack a higher density of users into
a given area than would be possible with traditional RF engineering
alone. I fully support that idea as an alternative method of
mapping the network. It isn't necessarily a better method, that
depends on other systemic factors in a particular network, but it
is another powerful tool in our toolbox.

I would caution that our amateur networks are often sparse.
That leads to different tradeoffs in network topology than
for a dense network where a SS microcellular approach might be

better. Sometimes a beam pointed at a distant digital repeater
is the right answer.

I try to remind people over and over that networking is a uniquely
cooperative enterprise, and that one size does not fit all. Often we
should take steps that don't necessarily directly improve our own
station's throughput so that we can effectively improve the throughput
of the network as a whole. When everyone does that, everyone benefits.

> will be appreciated.

There is a manual for the TAPR TNC-2 at ftp.tapr.org in
/tapr/software_lib/tnc/tncdocs.exe which covers the TAPR 1.1.8 command
set. This should cover about 95% of the Tiny-2 commands (no mailbox).
A 'display' command at the prompt will give a list of most of them also
(without syntax, of course).

From: 4sl25@qlink.queensu.ca
Message-ID: <52jpi1$iug@knot.queensu.ca>
Source record: 34305

I have a KPC-3 tnc and in front of me I have the tnc manual telling me how to interface the tnc and hand-held radios.

However, I need to know which schematic to look at make the connectors to my IC-W31A hand-held. Do I use the 2AT style hand-held radio schematic or the W2A style?

Any help would be appreciated.

thanks,

I have recently been using the internet phone software on my PC. I have got to say it has been very interesting so far. Great DX! :)

I would like to get information on the technical bells and whistles on the linking of repeaters over the internet/Iphone.

Is the software available on shareware? What are the hardware requirements? etc. I would like references to any publications on the subject as well.

Please post or e-mail me please.
And it's said that ham radio offers no more challenges. There is always something different to do with this hobby.
27yrs at it and still loving ham radio!
Tnx all, Transmit happy! (sorry Nissan)

Source record: 34307

I've successfully made the cables to hookup my KPC-3 to both computers
and the transceiver (Kenwood 742).

Unfortunately, the RECEIVE light on the TNC always stays on; the TNC
will only receive and not transmit; and I can see all the traffic of the
local packet BBS.

If I change the carrier detect (CD) option in the TNC to "external" the
RECEIVE light turns off; the TNC will transmit, but not receive; and I
cannot see all the traffic of the local packet BBS.

Cany anyone help?

TIA & 73's,

> Ideas?

Hello;

I have an MFJ1270B, and I imagine that the two are close enough
together for my experience to help.

In the 1270, there is jumper that must be installed to key the
HT.(JMP K) This feeds the keying line to the audio line through
a 47 Kohm resistor (R107). When I was using this with the HTX 202,
it did not draw enough current to key the radio, so the radio never
transmitted.

The solution to this is to replace the resistor with a lower value.
I used 2.1 Kohms. This worked OK and I used my HTX 202 on packet
for several years with a Ramsey Amp.

Part numbers and values may vary on your 1278, but this sould get you
in the ball park.

Hi All,

I hope I don't offend any one by posting this off-topic message. If I do, I sincerely apologize.

I'm looking for people to test a logging program I created for the Pennsylvania QSO Party contest. I could not find any good logging programs for the contest that were Windows programs, so I decided to make one. Well, it's done to the point I can't elicit any errors. I need some people to "push some buttons" and see what happens.

The only thing I can offer in return for your help is a copy of the software at no charge. This will include any and all updates to the software any time I make any. I'm planning on making changes at least once each year as the new rules and/or sections come out.

System requirements are a 486 or better processor with 8 MB RAM (that's the only computer I've tested it on) and Windows 3.x, Windows95, or Windows NT. Approximately 5 megabytes of disk space is required for installation, and additional disk space for the log files.

If you're interested, please contact me by e-mail and I can e-mail you a copy (3 disks) or I can post it to the Newsgroup.

Thanks In Advance,

The W2A style wiring in the KPC-3 manual indicates only ONE plug on
the top of the radio, whereas the 2AT style shows two plugs --use the
one appropriate for your radio. (If it has one plug, use the W2A
style.

Set the CD command in your KPC-3 to SOFTWARE - the wiring you have to
the radio must be unsquelched audio and this allows you to receive and
transmit with this configuration.

From: 4sl25@qlink.queensu.ca
Message-ID: <52mc5s$97c@knot.queensu.ca>
Source record: 34320

I am currently on Queen's University at Kingston, ON Solar Vehicle Team. We will be racing in Australia sometime next summer.

I need advice to the following problem:

There are a number of pieces of data that we need to be able to either get at transfer for the weather guy. We need satellite data, ie. IR and visual photos of Australia. Unfortunately it does not seem likely that we will receive our own satellite reception system. We also need to be able to communicate with Montreal where Environment Canada will be opening a window over Australia (especially for us) on their giant CMC numerical model. We also need to be able to get weather data from the weather guy (who will be part of the scout party) back to the car itself for processing in the strategy vehicle. Failing satellite phone or some other expensive option we have to fall back on data communication over radio. Kenwood has supplied us with three TRS-680H (I know the number is right but the letter prefix may not be) "low band FM trancievers" which are supposed to have a range of about 400km. They were also supposed to supply radio-modems, but for some (as yet unexplained) reason they decided these were not important. What we foresee is the scout driving ahead of the main party to a town, jacking into the net, getting whatever information the weather guy needs, then getting on the road, having the weather guy process the data while on the move and then using the data radio to send back the processed data to the strategy van. We have the computers, we have the radios; what we need is advice on how to connect the two.

Please email your suggestion or advice to me at 4sl25@Qlink.QueensU.CA

>
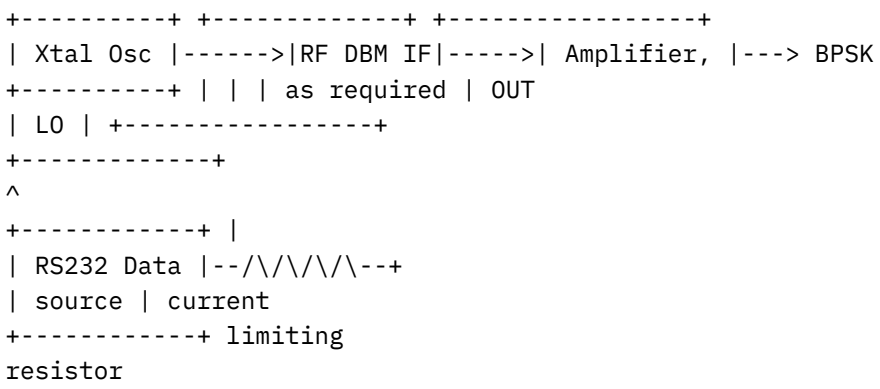
> Andrew VK6JBL

The easiest BPSK generator is an ordinary double-balanced mixer. Driven
with
one polarity, it has zero phase shift; reversing the polarity reverses
the
RF output phase. The bipolar drive can be derived simply from an RS232
signal source with a series current limiting resistor. Therefore a low
power
BPSK generator looks like



Notes:

The DBM's "LO" Port is the phase reversing input. The "RF" and "IF"
ports should be interchangable.

Most DBM's will work OK to input signal levels ~0 dBm. Don't overdrive
the DBM!

The resultant BPSK will be very broadband, and if you want to transmit it on the air, you need some band-limiting in the output RF path. You can also restrict the bandwidth by shunting a capacitor across the "LO" port to gnd.

The DBM will act as an attenuator depending on the supplied "LO" current.
Therefore the current limiting resistor can be used to adjust signal levels. Attenuation (in dB) is typically inversely related to the current up to a few ma of drive.

The RF frequency is specified by the DBM's manufacturer and depends on the diodes and transformers used in the DBM. 500 MHz is common. The "LO" drive frequency is typically comparable to the RF frequency, so 19k2 rates
are NO!!! problem. Some DBMs have the "IF" port limited to lower frequencies
than the RF or LO ports, so read the manufacturers specs.

Nice, suitable DMSs are packaged with 3 RF connectors (BNC, SMA, etc) by many manufacturers (HP, Relcom, Adams-Russell, MiniCircuits, etc). If you
can't find any on surplus or in your junkbox, browse
http://www.minicircuits.com/

Hope this helped -- 73 de Tom, W3IWI

: *continuous phase* (no sudden phase jumps between symbols).

: See "The Viterbi Algorithm" by G. David Forney, Proceedings of the
: IEEE, March 1973, p. 268. This is a tutorial on the Viterbi
: algorithm that had been invented six years earlier as a way to
: decode convolutional codes, but turns out to have many other uses
: as well, such as decoding FSK, dealing with intersymbol interference,
: and recognizing text.

: Forney claims that Viterbi decoding of phase-continuous FSK that
: takes into account the "memory" of the modulator performs 3 dB
: better than the best you can do with coherent detection over only
: one symbol interval, and as good as coherent detection of
: antipodal BPSK.

: I believe Dave Mills, W3HCF, has implemented something like this
: for the TAPR DSP-93 box.

: Phil

You might also take a look through the ham news groups for a circuit and software called HAMCOM(M?). The schematic is included in the documentation and is pretty easy to assemble. The accompanying software has a freq specturm display, and decoders for CW, RTTY, AMTOR/SITOR and I believe PACKET. Quite a few folks around here have built them AND used them successfully. Have fun. 73, John

Hello,

read your mail in the news (I am DG3RBU of BayCom).
Our dead site is currently dead due to political problems
with the provider, sorry.

You can get the BayCom Software from PacComm or from Tigertronics
in Grants Pass, Oregon. It should have come with your BP-9600
when you purchased it (but may be it is not .. we are not very
happy about having PacComm as a distributor for the moment).

There have been various requests what has happened to the BayCom
Web page. Currently it is unfortunately dead most of the time.
Having an internet page is quite expensive here in Germany, we
had to pay per request. Because the number of requests was
so high, costs ran away and as a small group (we are not a business)
we could not finance it any longer.
We are currently searching for a new home for the pages which are
cheaper, but did not succeed yet. I will post it as soon as it
is available again.

Hello, Folks:

On October 13, 1996 the Eastern Ozarks Amateur Radio Club (EOARC) will sponsor a Fox Hunt in St. Francois County Missouri.

Sign up will be from 1300-1330 at the Mineral Area College parking lot in Park Hills (formerly Flat River) and the Hunt itself will start at 1400.

Entry is _FREE_ but you must register!!

Maps of St. Francois County will be provided.

The Fox will live on 2m FM simplex and the exact frequency will be announced by the Fox at 1400. The Fox will be somewhere in St. Francois County.

Certificates and ribbons will be awarded.

From St. Louis, take Interstate 55 south to US highway 67 south to the Leadington/Park Hills exit then turn left.

From Cape Girardeau, take Interstate 55 north to US Highway 67 south as above.

From Poplar Bluff, take US Highway 67 north to exit as above and turn right.

You may call on the EOARC repeater on 147.030 (+600) for talk-in.

All Amateurs are welcome and encouraged to attend!

Take Care & 73

From: brian@rainier.nds.com
Message-ID: <52oupf$dth@rainier.nds.com>
Source record: 34330

I am wanting to get started in packet. I have a 2M/75CM HT, an IBM PC clone, a DSP56002EVM board, and a SMALL budget.

I've found some software that is suppose to turn the EVM board into a 1200 baud MODEM and schematics to connect the EVM board to an HT. The trouble I'm having is what software to run on the PC. The software for the EVM board suggests that I should try one of the xNOS programs. Is this a good suggestion for a beginner? Is there something better?

Taking the previously mentioned suggestion, I downloaded the TNOS software, hoping that it would help. Unfortunately, it asked more questions than it answered. If TNOS is a good route for a beginner to take, what configuration options should I choose?

I am open to any suggestions you are willing to throw my way.

Thanks,

Brian

Yes. Linux 2.0, appropriate utils and net-tools, Apache web server,
a useless little BBS for AX.25 connects, sendmail for tcp/ip mail, ftp
is also available. You can try it out if you like; telnet to
electron.goodnet.com from the internet, login as guest, and then you can
telnet to the NOS boxes in the area such as lksd.ampr.org, kf7tp.ampr.org,
etc. via my 9600 baud link on 144.91. Please don't do this unless you
are a licensed ham however.

It actually does act differently from NETROM nodes in that a KA-Node is more or less a smart digipeater. They are totally unaware of any other nodes in the area and they don't network. In a dual-port Kantronics TNC, the KA-Node allows cross-port connections but, again, node tables are non-existant so you would have to run the heard list to find stations to connect to. The new K-Net option for KPC TNCs is a NETROM type node which will pick up node broadcasts and have node tables. A much better system, IMHO.

Yes, but local ordinances could very well put safety and vehicle
restrictions to work which only affect the equipment as installed
not the actual operation. I've never seen it at work, but some states
have scanner laws which have been upheld consistently. Same
would be at work here. Washington State, like Washington DC,
likes to find creative new ways to tax it's citizens.

Without a problem, I'm using it for about 3 years now.

First you need the driver prg (just like you need tfpcx for gp, sp,...), it's called ax25drv.zip . You can find it on ftp://ftp.ucsd.edu/hamradio/packet/tcpip/baycom/

In your autoexec.nos you just add something like:
" attach packet 60 baycom 5 256 "

That should do it.

PACKET>EAST MEETING

SATURDAY, OCTOBER 12th

GOLDSBORO

The next hurricane to hit North Carolina will be Saturday, October 12th. I know that because we are scheduling a Packet>East meeting for that day, and the past two times we scheduled a meeting, we had a hurricane instead. So, batten down the hatches... but in case there isn't a hurricane, here are the details of the meeting:

Date: Saturday, October 12th, 1996

Time: 1:00 p.m. (lunch at Noon)

Location: Wayne Community College in Goldsboro, in the "Seminar Room" LC-131.
(Lunch at Wilburs Barbecue, Goldsboro)

Directions: US Route 70 Bypass, to Wayne Memorial Drive (that's about half-way around the bypass from either side of town), then north about a mile to the college, on your right. Room LC-131.

(Wilburs BBQ in on the Rt. 70 bypass, on the east side of town.)

AGENDA: Catch up on what's been going on... Elect officers, appoint new frequency coordinator.

Discuss SERA, the new NFCC, and their relationship with packet.

Packet>East meetings are designed for BBS, node, system, network and PacketCluster sysops, but anyone interested in packet is welcome to attend.

Join a few of us for lunch at about noon at Wilburs for some down-home NC barbecue.

From: 4sl25@qlink.queensu.ca
Message-ID: <52tnag$6p0@knot.queensu.ca>
Source record: 34254

I am reposting my question in the hope that I can get some advice.

I am currently on Queen's University Solar Vehicle Team.

I need advice to the following problem:

Kenwood has supplied us with three TRS-680H (I know the number is
right but the letter prefix may not be) "low band FM trancievers"
which are supposed to have a range of about 400km. They were also
supposed to supply radio-modems, but for some (as yet unexplained)
reason they decided these were not important. What we foresee is the
scout driving ahead of the main party to a town, jacking into the net,
getting whatever information the weather guy needs, then getting on
the road, having the weather guy process the data while on the move
and then using the data radio to send back the processed data to the
strategy van.

We have the computers and the radios; what we need is advice on how to
connect the two.

I work packet radio and I think a high-speed tnc could do the trick.
So do we need special tnc-like rig to do this?
If so what brand and model is best for this kind of work?

Any advice is greatly appreciated.

Hi ...
I've been running a HP-100LX for quite a few years portable.
I started with a Baycom (externally powered) but switched to a
Paccom TNC (the one that's the size of a pack of cigarettes).
The Baycom is allright for fooling around but relying on it
day-in and day-out was not possible.

Using the Paccom, I am able (in my 2 mb 100) to run
a full MSYS BBS (KNode, Netnode, BBS, IP, conference, etc.).
As a little application, I use the MSYST terminal program that is
available in the distribution disks.

> [SNIP]:
Hey this is a great idea, the entire world has a soundcard. im tired
of the "box clutter" in my swl site and would love to trash the decoder
de' jour from aea. while ur writing the software,, make it for swl'ers
,, that is a dx'er's interface not a ham interface. so it needs hf /
vhf frequency storage with point and click interface on win 95,, use win
95 soundblaster drivers, support all modes with one program and
selectable interface including cw / fax / amtor / baudo, etc. have a
"signal acquisition mode" like AEA that's actually worth a shit.
automatic controls on freq shifts baudrate and bit inversion. automatic
audio level controls via stock soundblaster interface. hey,, u want my
$100 bucks up front?

We have bougth a PK-96 modem for testing.
Our plan is to communicate with 120 other HAM modems/radios (PK-96)
The main question is : Can we get a bit rate up to 9600 with AX25 ?
The baud rate is 1200 or 9600.
How long (worst case) will it take to transmit one packet to all the 120 radios ?

What's the best radio and modem for this job (small size !) ?

Thanks in advance for any help.

Asbjoern.

Well, as long as it has a serial port and some way of talking to it, most
any palmtop should work. I've seen the HP95LX in use, although the screen
is only 1/4 the size of a regular PC Screen (40x12, I think), it even has
built in communications software. A better option, although I've never
seen it done, but there shouldn't be any reason why it wouldn't work, is
to use the HP200LX as it has a full size screen.
Another option I'd like to try is to use an HP Scientific Calculator
such as the HP48G or HP48GX, both of these have serial ports and I've
heard tell of vt52 emulation packages for them. They'd be a pain to type
on at first, but it shouldn't be hard to get used to. They're also pretty
cheap, the 48G is only $90 or so.

We have been running our Packet/Internet wormhole for 1 year now.. Pure
Linux
with AX25.. no XYZ-NOS required..
We even support WEB Browsing.. we wrote an axlogin to handle the logins...
Our setup:
486 33mhz, 8meg ram, 1.2gbyte hard drive, ethernet card
2m 25 watt kenwood radio (ancient) on 145.05
2m Ringo Ranger
MFJ TNC in kiss mode
NODE CLARC at 100' with 50 watts.. gives us quite a range

We have over 200 usrs... each has their own shell account, we give club
members
space for their own web page, our club page and club SIGs pages are also on

this machine. We run listservers, etc.. also use Apache WWW server.
Telnet, FTP, Email, DX Cluster, Weather, Space News, NASA news, Convers
(World Wide Ham Chat) and much more.

We are going to be adding 9600 baud and are working on 2mb/s capability,
right now
at 1200 baud. News groups coming soon.. check out our wormhole www page, go
to the CLARC (Clear Lake ARC in houston tx, near NASA)...
http://www.clarc.org
then look for the Wormhole link

Won't work, Win95 soundcard drivers will produce much too much
transition times between receiving and transmitting. You'll need
to write your own soundcard driver to do anything reasonnable
in the modem field...

```
TAPR Office to reduce to minimum operations
-------------------------------------------

The TAPR Office will shutdown to minimum operations starting October 8th and
running at least until October 28th.

This means that Dorothy will not be working the office phones during this
period. The office will continue to operate, but at a much reduced level.
E-mail, US mail, Voice Mail, etc will still be received and recorded, but
everything will be processed at a very much slower rate during this period.

GPS-20 units have begun to ship. As of this e-mail approximately 40 units
have shipped. We are awaiting additional pins for the connector (suppose to
arrive Oct 11th) in order to complete the remainder of the units. These pins
replace the ones that were incorrect in the shipment we received. Once the
pins arrive, we will get the other units out as soon as possible.

The Motorola EVM56002 have been placed on order and are expected to arrive
sometime after Oct 21st. They will then be shipped out as time permits under
the operational schedule at the office. There are something like 60 of the
200 units still available in this purchase at the $85 + $10 s/h price. Check
the TAPR Web page for full details www.tapr.org. First come basis on these
units.

TAPR is sorry for any delays that the reduced operations schedule at the
office might cause. If everything turns out positive, the office should be
back operational towards the end of October.

Cheers - Greg Jones, WD5IVD
President, TAPR

On the 19-20 of October: Look up this page:

http://www.algonet.se/~jhe/jota.html

and you will hopefully see our transmitting frequency
from an IC-735 operating in the Jamboree On The Air 1996.
The Habo scoutgroup will operate from abt 50Km N of Stockholm.
Just give us a call...

All the best! 73 es Cu at the JOTA/I!

Never used MBBIOS under WIN95 but have used other DOS com drivers.
Delete the reference to COM2: in the system setup, device drivers
section (under ports, COM2:). If WIN95 doesn't know its there, then
it shouldn't object to MBBIOS grabbing it.

5278. WANTED: CPU chip MC3890 for Heathkit Wx ID-4001

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-10-03 00:00:00 UTC
From: johng@unity.ncsu.edu
Message-ID: <530aub$r58@taco.cc.ncsu.edu>
Source record: 34274

I am in need of obtaining the CPU chip, MC3890, for a Heathkit Digital Weather Computer Model ID-4001.
This chip must have the code to run the weather computer. My unit of 15 years was rendered useless recently
by a lightning stike.

Any assistance would be greatly appreciated.

Also, would consider purchasing a working ID-4001.

Please e-mail me at john_garrett@ncsu.edu

There is information on the Net (location escapes me)
which provides information about the ARRL project. I found
by searching Alta Vista.

However, what I'm interested in is finding a source for the
Motorola MC13055. The Australian distributors will only get
them in minimum quantities of 100! I'd be interested if
someone could let me know a source where I can order them
via credit card. A contact number (phone/fax), WWW site
or e-mail address would be appreciated.

Regards,

Mark Little (markl@dove.net.au)

From: swoodwar@fix.net
Message-ID: <5333lj$1h8@twizzler.callamer.com>
Source record: 34280

Have the AEA WEFAX module and software. Goes in series
with your Comm port cable to your packet TNC, or just plug
into a Comm port. Plug into HF radio for audio. Load software
and receive weather and other FAX transmissions. Excellent
resolution (don't bother using unless you have SVGA monitor).
$25 shipped UPS to you.

From: mars@cuci.nl
Message-ID: <5346l4$qtf@hera.cuci.nl>
Source record: 34285

Hello Friends.
I am running TSTHOST 1.43a and BPQ 4,08a with the special BPQ-DED driver for TSTHOST.
It is working fine but after a few minutes (or sometimes seconds) TSTHOST is creating resyncs with the driver!!!.
And the programm never recovers from the resyncs.
The version of the BPQ-DED.EXE is 1.1e
Has anyone the Solution for my problem of perhaps a newer BPQ-DED driver?

Greetings from Marcel

RESULTS OF PACKET RADIO BBS SURVEY

JUNE - SEPTEMBER 1996

by Marty Albert KC6UFM

The survey consisted of 12 questions. In addition to the replies themselves, there was also information gathered both by the Internet survey page (through HTML and JAVA coding) and on the Packet Radio network.

This message is grouped into four topics:

(1) REPLY DATA
(2) ANSWERS
(3) OTHER INFORMATION GATHERED
(4) OVERALL COMMENTS

SECTION 1 - REPLY DATA

NUMBER OF REPLIES:

I received replies to the survey as follows:

Internet = 397 (81.19%)
Packet = 91 (18.61%)
US Mail = 1 (0.20%)

TOTAL = 489 (100.00%)

NUMBER OF DUPLICATE REPLIES:

There were a number of duplicates received as follows:

Internet = 4 (22.22%) from 2 respondants
Packet = 14 (77.78%) from 5 respondants
US Mail = 0 (0.00%) from 0 respondants

TOTAL = 18 (100.00%) from 7 respondants

(NOTE: Duplicates were handled by taking only the most recent copy and discarding the older replies.)

DISCARDED REPLIES:

Other than duplicates, the following is a summary of discarded replies due to inability to read the replies:

Internet = 0 (0.00%)
Packet = 1 (100.00%)
US Mail = 0 (0.00%)

TOTAL = 1 (100.00%)

COMMENTS:

As can be seen, the vast majority of replies were via Internet. I found this interesting for two reasons: (1) The survey was about Packet Radio and I would have expected more interest than was shown by the Packet community, and (2) There were two people on the Internet who were pushing very hard to have the survey available on Packet as they felt there would be a high response rate.

It is also interesting that there was a much higher number of duplicates sent by Packet users in terms of absolute numbers (14 vs 4); Percent of all duplicates (78% vs 22%); And percent of all replies (3% vs 1%). It should be noted that the Packet duplicates had different BIDs (all appeared valid) and dates from their respective PBBS. Also, the Packet duplicates had different answers. I frankly was expecting more duplicates from the Internet HTML version of the survey... Since this was a form type response, it would have been easier both to make an error and to just re-submit the survey. On Packet, users had to actually write a reply message and send a Packet message, a much more difficult process!

The only discarded reply looked to have been trashed by HF forwarding stations between the US and Western Europe. This one reply represents only 0.20% of the total and so has little impact on the survey.

Please see the OTHER INFORMATION GATHERED section for additional details that are interest.

SECTION 2 - ANSWERS

This section will look at each question and the answers received. The format for each each question will be the same:

Question Statement
Answers and number of replies
Discussion

QUESTION 1

What Packet BBS program do you use now, or if you are planning to set up a BBS in the future, what BBS program are planning to use?

F6FBB 103 (21.06%)
W0RLI 26 (5.32%)
AA4RE 21 (4.29%)
MSYS 73 (14.93%)

DOS/Windows NOS 75 (15.34%)
Unix/Linux NOS 29 (5.93%)
APLink 2 (0.41%)
CBBS 0 (0.00%)
G1NNA 0 (0.00%)
SV7AIZ 0 (0.00%)
TheBox 16 (3.27%)
UFQBBS 0 (0.00%)
WA7MBL 1 (0.20%)
WinLink 7 (1.43%)
XOBBS 0 (0.00%)
Other 22 (4.50%)
None 114 (23.31%)

TOTAL 489 (100.00%)

It should be made clear that these numbers are based only on replies to the survey and not on actual ditribution of the various software. In other words, there very likely are many more people using a particular software package than what is shown here.

It is assumed that the NONE answer are those that do not now and do not plan to operate a PBBS. This was a failure in the survey structure in that such an answer should have been available while, in fact, it was not.

In any event, two trends are clear: (1) F6FBB is the single most popular PBBS program and (2) The various NOS systems are, when totaled, even more popular.

QUESTION 2

How long have you operated a Packet BBS?

Less than 1 year 46 (9.41%)
1-2 years 82 (16.77%)
2-3 years 74 (15.13%)
3-5 years 58 (11.86%)
More than 5 years 51 (10.43%)
I don't run a BBS 178 (36.40%)

TOTAL 489 (100.00%)

The main information from this question is that about 1/3 of all respondants are not PBBS SysOps. This is about what I had expected when this started.

One interesting fact is that over 40% of our BBSs have been around 3 years or less with nearly 10% less than a year old. This shows a fair growth rate and an attraction to new people to Packet.

QUESTION 3

If you are thinking of operating a Packet BBS, how long before you plan to your BBS on the air?

Less than 6 months 38 (7.77%)
6 months - 1 year 26 (5.32%)
1-2 years 12 (2.45%)
More than 2 years 3 (0.61%)
I run a BBS now 309 (63.19%)
I wouldn't run a BBS 101 (20.65%)

TOTAL 489 (100.00%)

This question again confirms that about 2/3 of the replies were from current SysOps. We also note here that about 15% of all current users are planning to move into being s SysOp in the next 2 years or less.

QUESTION 4

As a SysOp (or possible SysOp), what is the MOST important feature a BBS should have?

Easy set up 36 (7.36%)
Easy day to day operation 58 (11.86%)
Lot of features 19 (3.89%)
Telephone modem support 4 (0.82%)
Good documentation 127 (25.97%)
Author support 71 (14.52%)
Lots of add-on programs 8 (1.64%)
TCP/IP support 55 (11.25%)
Variety of TNCs supported 2 (0.41%)
I'm not a SysOp 109 (22.29%)

TOTAL 489 (100.00%)

Little of this surprised me as I had expected that Documentation, Author Support, and Easy Operation would be of prime importance.

One thing worth noting is the desire for TCP/IP Support. However, taking this in light of the number of SysOps using a NOS variant, this is not at all unusual.

QUESTION 5

As a SysOp (or possible SysOp), what is the LEAST important feature a BBS should have?

Easy set up 18 (3.68%)
Easy day to day operation 21 (4.29%)
Lot of features 36 (7.36%)
Telephone modem support 41 (8.38%)
Good documentation 4 (0.82%)
Author support 1 (0.20%)
Lots of add-on programs 92 (18.81%)

TCP/IP support 36 (7.36%)
Variety of TNCs supported 129 (26.38%)
I'm not a SysOp 111 (22.70%)

TOTAL 489 (100.00%)

The correlation between this question and Question #4 is good. Again, there were no real surprises here to me.

QUESTION 6

As a Packet User, what is the MOST important feature a BBS should have?

Good HELP systems 142 (29.04%)
ANSI support 25 (5.11%)
Other graphics support 42 (8.59%)
TCP/IP support 41 (8.38%)
Selective message reading 109 (22.29%)
File transfers 53 (10.84%)
White Pages support 47 (9.61%)
Multiple languages 9 (1.84%)
Other 21 (4.29%)

TOTAL 489 (100.00&)

I found two surprises here to my own preconceptions... (1) The relativly high number of users wanting file transfers (nearly 11%); and (2) The very low number of people wanting multiple language support (under 2%).

QUESTION 7

As a Packet User, what is the LEAST important feature a BBS should have?

Good HELP systems 22 (4.50%)
ANSI support 61 (12.47%)
Other graphics support 106 (21.68%)
TCP/IP support 87 (17.79%)
Selective message reading 25 (5.11%)
File transfers 27 (5.52%)
White Pages support 29 (5.93%)
Multiple languages 101 (20.65%)
Other 31 (6.34%)

TOTAL 489 (100.00&)

QUESTION 8

What type of network support is MOST important built into a BBS?

TheNET/NetROM 183 (37.42%)
ROSE 14 (2.86%)
TCP/IP 161 (32.92%)
Other 29 (5.93%)
None 26 (5.32%)
I don't know 76 (15.54%)

TOTAL 489 (100.00%)

It should be no surprise that TheNET and NetROM support is the leader here with TCP/IP functionality a close second.

It is interesting that more people were in favor of no network support than for ROSE support. While in my local area, ROSE never did catch on, I was under the imprssion that it was quite popular in some places.

QUESTION 9

What type of network support is LEAST important built into a BBS?

TheNET/NetROM 27 (5.52%)
ROSE 231 (47.24%)
TCP/IP 8 (1.64%)
Other 114 (23.31%)
None 2 (0.41%)
I don't know 107 (21.88%)

TOTAL 489 (100.00%)

This question supports the opinion that TheNET, NetROM, and TCP/IP support are favored while ROSE is considered not important.

QUESTION 10

If a Packet BBS that you really liked were available as a SHAREWARE program, how would you pay for it?

Less than $10 86 (17.59%)
$10 - $25 74 (15.13%)
$25 - $50 38 (7.77%)
$50 - $75 23 (4.70%)
More than $75 11 (2.25%)
I wouldn't pay 257 (52.56%)

TOTAL 489 (100.00%)

The results here are both surprising and a bit frightening. Please see Question 11 for more comments.

QUESTION 11

If a Packet BBS that you really liked were available as a COMMERCIAL program, how would you pay for it?

Less than $10 91 (18.61%)
$10 - $25 68 (13.91%)
$25 - $50 30 (6.13%)
$50 - $75 12 (2.45%)
More than $75 4 (0.82%)
I wouldn't pay 284 (58.08%)

TOTAL 489 (100.00%)

The results from this question and Question 10 do not bode well for BBS authors and for any company that wishes to publish a BBS program. There is good correlation between the two questions with the Commercial replies being slightly lower than for Shareware.

Several comments from responants stated that this is a hobby and/or this is Amateur Radio and no one should make a profit from the service. I wonder if this applies only to software or if Kenwood et al should not be selling radios?

The most frightening comments were several that stated that Hams are, in general, software pirates and that any Shareware or Commercial software would soon be spread world-wide to any Ham that would want it. One comment even stated that there is a "network" of Hams on the US West Coast that regularly give away Commercial software.

QUESTION 12

What operating system would you like to run a Packet BBS under?

MS-DOS or clone 145 (29.65%)
Windows 3.1 or 3.11 111 (22.70%)
Windows 3.x with Win32s 8 (1.64%)
Windows 95 122 (24.95%)
Windows NT 12 (2.45%)
Unix or Linux 48 (9.82%)
Apple Macintosh 13 (2.66%)
Commodore Amiga 3 (0.61%)
Atari ST/TT 1 (0.20%)
Other 26 (5.32%)

TOTAL 489 (100.00%)

Sadly, I had overlooked OS/2 when the list was set up. I presume that OS/2 makes up at least a good part of the Other responses.

The surprising thing here is that most folks are still using DOS vs a more sophisticated OS. With the availablility of Windows 3.x, Win32s, Windows 95 and NT, and Linux offering more power and flexibility than DOS, one must wonder why so many are still using DOS. Perhaps this is related to the cost factors seen in Questions 10 and 11.

Also a bit surprising is the number of folks using a NOS variant and yet less than 10% are using Linux or Unix.

One thing that is clear is the relativly few people using some 680xx based computer. Only about 6% of all respondants use a non-Intel computer and OS.

SECTION 3 - OTHER INFORMATION GATHERED

This information, while interesting, does not really impact on the survey directly. Because of the nature of the supplimental data, it will be presented broken into two parts...

INTERNET REPLIES

Extra information from the Internet was gathered by means of JAVA, CGI, and HTML coding and found the following about respondants:

OS USED

DOS 24.05%
Windows 3.x 55.22%
Windows 95 12.53%
Windows NT 2.11%
Unix 0.30%
Linux 2.08%
Macintosh 3.52%
Atari ST/TT 0.07%
Other 0.12%

OS REPORTED CPU

8088/86 0.00%
80186 0.00%
80286 0.05%
80386 57.25%
80486 22.13%
80586 12.63%
80686 0.25%
68000 0.32%
68010 0.00%
68020 0.23%
68030 1.21%
Other 5.93%

OS REPORTED CLOCK SPEED

< 10 MHz 1.31%
10 - 20 MHz 16.58%
21 - 50 MHz 52.70%
51 - 75 MHz 19.22%

76 - 100 MHz 8.61%
101 - 150 MHz 1.13%
> 151 MHz 0.45%

WEB BROWSER USED

Netscape 1.x 11.03%
Netscape 2.x 18.66%
Netscape 3.x 0.23%
MS Explorer 1.x 13.62%
MS Explorer 2.x 9.51%
MS Explorer 3.x 0.58%
Mosaic Any 12.52%
Text Based 28.21%
Other 5.64%

Overall, this shows that survey respondants tend to use older computers (386 based) at relativly slow speeds (21-50 MHz) with Windows 3.x and a text based Web Browser.

This is a bit surprising to me... I had expected to see much more modern hardware in use.

PACKET REPLIES

The only item to report here is that it took, on average, 16 days for a private packet reply to reach my station.

SECTION 4 - OVERALL COMMENTS

First of all, I want to thank all of those that took the time to reply to this survey. It has provided some good information that, if nothing else, will generate a few flames and heated discussions in the Packet community!

Because of the correlations of many questions, I feel that, for the sample group, the data appears to be valid.

A few general conclusions can be made:

(1) F6FBB software is the most popular single program, but the NOS variants are coming on very strong.

(2) Most of our PBBS stations have been in operation less than 3 years.

(3) SysOps want and need good documentation and author support.

(4) Users want and need good online help systems.

(5) TheNET and NetROM are by far the most popular networks but TCP/IP is gaining rapidly.

(6) Most SysOps will pay little, if anything, for BBS software.

(7) DOS continues to be the most popular OS for BBSs.

What does all this mean? Like any survey, that is a matter of interpretation of the data and has a large personal bias component.

In general, we must ask why the results are the way that they are...

Why do we have so many new BBSs on the air? Is it because the "old timers" didn't bother to answer? If so, why not? Is this reality? If so, what happened to the older stations? Does this relative lack of experience have any impact on the Packet network in general? Good? Bad?

Why the strong outcry for good documentation and author support? Do SysOps feel that they are not now getting this? If so, why not? Is this tied to the position that most will pay little for software?

Why the growth in NOS and TCP/IP? Are these systems better than what we have now or is this just a passing fad? What benefits does TCP/IP and NOS offer as compared to traditional BBSs and vice versa? Is NetROM and TheNET doing what we need to be done or are they just hanging on based on tradition or simple distribution?

Why do users ask for good online help? Are they not getting that from current BBS programs? Do current programs have online help that is not set up correctly by the SysOp? Is this tied to the SysOp desire for good documents?

Why do SysOps appear to be unwilling to pay for software? Does current Shareware work? How much have the several authors collected so far? Since this is Amateur Radio, should all software be free? What about hardware? Are there really groups of Hams that distribute pirate software or are respondants just blowing off hot air?

Why are so many Hams using DOS when more powerful OSs are available? Is this tied to the unwillingness to pay for software and/or the apparant use of older, low end computers? Is this more a function of a lack of Windows and Unix based software for Ham use? Is this even a problem or concern at all?

I will leave the detailed interpretation of the data and the debate over its meaning to the masses. Please keep in mind that this is a VERY small sample and should in no way be taken to represent all Hams or even all Packet operators.

Again, thanks to those that answered the survey and thanks for reading these results.

Take Care & 73

I'd recommend that you look at Winpack. It has all the same
neat features that TPK has....it synchronizes bulletin numbers with
FBB bulletin boards, automatically downloads selected messages or
any bulletins with key words in headers, etc. Also it is free.
Plus its easier to set up than TPK was.

You can download it here: http://www.healey.com.au/~vk2yx/winpack.html

There is not much point in using 2400 baud if nobody near you is
using the same. Around here most all 2400 baud activity has died
out because 1) it was not compatible with the 1200 baud users and
2) it didn't offer very much more performance over 1200 baud.

Its probably possible to upgrade your PK88 to 2400, but just as
easy to go all the way to 9600 and get a real improvment.

As yoiu can see, I'm not laughing. Heath uese the same kind of interface off a serial port for the H8/H89 kits. The schematic is in an early is of REMARK magazine. That was the rag mag published for the Heath Users Group. If you are VERY lucky, there may be an archived copy set of that which some kind soul gave to your local college library.

A more likely place for you to get the info you need toi build one is from a person that has the "CT" contest program. That program, I think, can drive a key line direct from the serial port on your computer, the same way that was used in the early Heath's and so on.

It should be a fairly simple matter to figure out which pin on the Trash 80 to use for the keying line diode isolated hookup. To find out the pin that is holding the state level changes for keying, simply measure the voltage on the pins in the serial line with a good DVM or VTVM. The one that is swinging in line with a sent string of dots or dashes is the line they are using for key state signalling.

At that point, you can take the isloation circuit in any of these connector deals as I see it, and adapt the same thing to your situation. Observe that you may require the opposite polarity to run your gear! That can be done by using a stage or so of single transistor switching. In order to get my RS-232 direct port keying to work from my computer program I wrote to do all this matched up together with the MFJ-1278 key line control in parallel with that, I had to provide for a simple single transistor isolation switch...

Sure! A packet cluster is an RF BBS system. You, and many other local
users log on to it over the air, all at the same time! Formatted messages
about stations that are being heard in real-time are echoed in sequence to
everyone that is logged on, as well as making a back log file about what
all was submitted to the cluster.

The cluster can also share information with other clusters! That way, any
information entered by one person not only goes to the people connected in
the net at that cluster, but is also echoed to all the other clusters in the
linked net as well!

It is not unusual, not the Internet access can be had in near-real time all
over the world, to find information posted on one cluster appear on clusters
all over the world in seconds.

Some clusters also have direct internet access ports through tel net. They
can not only be accessed by over-the-air users, but over the phone line and/or
over the Internet by telnet as well!

No place to hide any more...

:)

A source for a free ware cluster program is:

http://zone.pspt.fi/clusse/

Don't forget to add that last fraction bar on the end! You'll be reminded of
you ineptness at handling UNIX style file names if you do!

I've been using my HP200LX with a KPC-3 for a couple of years. The KPC-3 will operate for a LONG time on its 9V battery and has nice mail forwarding and remote control options. I also regularly run APRS on this system while mobile with a GPS also connected...

Hopefully I'll be able to tell you something about the PacComm Pico Packet if I ever get this thing to work :)

Is this Mpeg-1 or Mpeg-2? Is it system stream or transport stream?

If Mpeg-1, you're going to need about 1.5 MBits/Sec.

Mpeg2 transport stream is much bigger, on the order of 6 MBits/Sec.

>traffic and converse between all of these points. Does anyone have any
>ideas? Thanks.

An off the shelf, though not ideal, solution would be to install
a packetcluster node at the OEM. That would impose no special
requirements on the outlying sites, other than remembering which
amateur arcania meant what, IE a DX spot would be a broadcast to
all stations, etc. This would work if you expect amateurs to drag
in and set up minimum packet stations each time the need arises.

Better would be to install a Linux system at each site, configure
up a TCP/IP network among all the stations on packet, and use the
ordinary unix and TCP/IP tools to converse and exchange messages
and files, IE write, mailx, ftp, etc. You could even setup web style
"chat rooms" for the various departments, though that could get ugly
if you don't use fast packet links (I'd use 56 kb). All the packet
and unix details could be hidden from the user by a nice menu system
you could cobble together with shell scripts. That's the approach I'd
take if the stations were to be permanently setup at the hospitals.

>Bad?

If this area is any indication, I think the main problem is PBBS
operator burn out. Most sysops seem to get a belly full of it after
a couple of years of putting up with the bitching and whining of
the users.

>Why the strong outcry for good documentation and author support? Do
>SysOps feel that they are not now getting this? If so, why not? Is
>this tied to the position that most will pay little for software?

Well, of course the better documentation lament is common to all
computer users, but the support for most of these PBBS systems is
sad, author support is practically non-existent, documentation is
poor, online help unhelpful, etc. And the reason is plain, you
usually get what you pay for, and they don't pay for this stuff.

>Why the growth in NOS and TCP/IP? Are these systems better than what
>we have now or is this just a passing fad? What benefits does TCP/IP
>and NOS offer as compared to traditional BBSs and vice versa? Is
>NetROM and TheNET doing what we need to be done or are they just
>hanging on based on tradition or simple distribution?

Besides the obvious advantages of TCP/IP for true networking, the
ability to run on many different platforms, the interoperability
with other networks, etc I think the big advantage is the documentation.
These systems come with full source code. You couldn't ask for better
documentation than that. :-)

It also doesn't hurt that they are free.

TheNET and Netrom hang on because they will run on low performance
TNCs used as nodes on low speed networks. Since low speed still
describes most amateur networks, that makes a good fit. For higher
performance networks, TheNET and Netrom can't compete because
the hardware on which they run isn't up to the task.

>Why do users ask for good online help? Are they not getting that from
>current BBS programs? Do current programs have online help that is not
>set up correctly by the SysOp? Is this tied to the SysOp desire for
>good documents?

I think this is just the universal computer user complaint. *Everyone*
wants better documentation (which they won't read anyway), and better
online help (which they don't understand because they didn't read the
documentation). And they all want instant telephone support and hand
holding (which they won't get because they aren't willing to pay for
it).

>Why do SysOps appear to be unwilling to pay for software? Does current
>Shareware work? How much have the several authors collected so far?
>Since this is Amateur Radio, should all software be free? What about
>hardware? Are there really groups of Hams that distribute pirate
>software or are respondants just blowing off hot air?

This is sad, but to a large extent a true situation. Amateurs, who
won't think twice about burning the plastic for anything shiny
with lots of knobs from Japan, just won't unlimber the wallet for
software. Many seem to think that any price over the cost of media
is somehow "highway robbery". Of course, never having written a
line of code themselves, they have no appreciation for the value
added to that media by the programmer. These same people complain
about the high cost of radios, but they pay that because they
know they can't get away with stealing radios. They think that
they can get away with stealing software (and they're usually
right). Even those who would feel qualms about stealing a diskette
think nothing about stealing what's on that diskette. Odd.

This isn't limited to amateurs, of course. Other computer users
are just as bad. To an extent, I can sympathize with their feelings.
A lot of software *is* overpriced and underproductive. A lot of
software *is* bug ridden and inflexible. And a lot of software
licenses are absurdly restrictive. I think Borland had the right
idea with their "like a book" licenses and pricing. I could take
a chance on a program priced "like a book" and if it didn't
meet my expectations, I wouldn't be out all that much, and I
could try to recoup some of the money by reselling it like a
used book.

I'm much harder to sell on a product that's priced at $199.
I'd better be *real* sure it's going to do what I need before
I shell out that sort of change (and not have the legal right
to resell it if it doesn't suit me). The latter point is
real important to me. If I buy a radio, its mine, I can
modify it, I can drill holes in it, paint it bright green,
or I can resell it. I own it. With most software licenses,
I'm only renting the software, I can't modify it, and I can't
resell it. That makes it worth a lot less to me.

I don't care how many hours a programmer invested in producing
a piece of software, it is only worth what I think it is worth
to me. If that works out to 10 cents an hour, then the programmer
didn't do a very good job of evaluating his market, designing
his product to meet that market, or coding his software to
actually implement that design correctly. While I don't condone
piracy, I think much of the wailing and knashing of teeth among
software producers over billions in lost sales is bunk. They lost
the sale when they priced the product too high relative to what
potential purchasers thought it was worth.

Those who pirated their product probably wouldn't have bought it
anyway, unless the price were more in line with what they thought
it was worth. That doesn't make piracy right, of course. It'd be
better if the software producer just starved due to lack of sales
at his absurd price point. Piracy often actually helps get a product
established with market share, however, so rather than starving,
the programmer actually winds up controlling a market segment.
I suspect that's why Microsoft has never aggressively pursued
those who pirated DOS or Windows.

>Why are so many Hams using DOS when more powerful OSs are available?
>Is this tied to the unwillingness to pay for software and/or the
>apparant use of older, low end computers? Is this more a function of a
>lack of Windows and Unix based software for Ham use? Is this even a
>problem or concern at all?

I suspect there are several factors at work here. One is that few
amateurs know about Linux. If they knew it was cheaper than DOS,
IE free, some might nibble. If they knew it would run on their older
low end 386 systems, a few more might nibble. If they knew it came
with full and complete documentation, not only online man pages but
also full source code, some more might nibble. If they knew that they
are free to modify it, give it to their friends, or do anything else
with it they like except claim it is their work and sell it for a
profit, some more might nibble. If they really understood the
wealth of features it offers them, many more would nibble. And
finally, if they knew that they could forget the three finger
salute they've come to know so well in DOS and Windows, hordes
might come forth to embrace it.

But I think they are frightened away because they believe that
they won't be able to comprehend or master it because it is
<horrors> unix, and that can only be mastered by high priests
locked away in MIS centers. Truth be known, and the high priests
don't want this to get out, its lots easier to manage Linux than
Windows when you get beyond the "insert disk, type a:setup <return>"
level. This is especially true when setting up and administering
networks. There *is* a steep initial learning curve, with cryptic
command names and some new concepts to be mastered, but once
you're past that it is smooth sailing.

Gary

5312. www.hamradio-online.com - new features all the time

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-10-07 00:00:00 UTC
From: vbook@vbook.com
Message-ID: <539ruv$6hb@kanga.accessone.com>
Source record: 34208
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.digital.misc,rec.radio.amateur.policy,rec.radio.amateur.homebrew,rec.radio.scanner,rec.radio.shortwave,aus.radio.amateur.misc,aus.radio.amateur.digital

If you have not visited Ham Radio Online in a while, stop on by. We keep adding new features and new stories all the time. We've just added a new ham radio photo gallery, made updates to the humor and newsletter sections and updated the library. Plus of course, new stories are added all the time. We've got many new stories in preparation, some mini-product reviews, and some ideas for new features you won't find anywhere else on the Net. We've even been sketching some ideas for a hilarious cartoon strip about ham radio and techie topics (but it will probably be a while before we have time to get this feature added!).

Stop on by and pay us a visit at http://www.hamradio-online.com

More ham radio fun than anywhere else. Now read in 46 countries around the world!

5313. PBBS Survey Results

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-10-07 00:00:00 UTC
From: marty@trucom.com
Message-ID: <53a3po$9b9@thepit.trucom.com>
Source record: 34209

(if this is a dupl;icate, please forgive me... My ISP had a News
Server problem that has been resolved)

RESULTS OF PACKET RADIO BBS SURVEY

JUNE - SEPTEMBER 1996

by Marty Albert KC6UFM

The survey consisted of 12 questions. In addition to the replies
themselves, there was also information gathered both by the Internet
survey page (through HTML and JAVA coding) and on the Packet Radio
network.

This message is grouped into four topics:

(1) REPLY DATA
(2) ANSWERS
(3) OTHER INFORMATION GATHERED
(4) OVERALL COMMENTS

SECTION 1 - REPLY DATA

NUMBER OF REPLIES:

I received replies to the survey as follows:

Internet = 397 (81.19%)
Packet = 91 (18.61%)
US Mail = 1 (0.20%)

TOTAL = 489 (100.00%)

NUMBER OF DUPLICATE REPLIES:

There were a number of duplicates received as follows:

Internet = 4 (22.22%) from 2 respondants
Packet = 14 (77.78%) from 5 respondants
US Mail = 0 (0.00%) from 0 respondants

TOTAL = 18 (100.00%) from 7 respondants

(NOTE: Duplicates were handled by taking only the most recent copy and
discarding the older replies.)

DISCARDED REPLIES:

Other than duplicates, the following is a summary of discarded replies due to inability to read the replies:

Internet = 0 (0.00%)
Packet = 1 (100.00%)
US Mail = 0 (0.00%)

TOTAL = 1 (100.00%)

COMMENTS:

As can be seen, the vast majority of replies were via Internet. I found this interesting for two reasons: (1) The survey was about Packet Radio and I would have expected more interest than was shown by the Packet community, and (2) There were two people on the Internet who were pushing very hard to have the survey available on Packet as they felt there would be a high response rate.

It is also interesting that there was a much higher number of duplicates sent by Packet users in terms of absolute numbers (14 vs 4); Percent of all duplicates (78% vs 22%); And percent of all replies (3% vs 1%). It should be noted that the Packet duplicates had different BIDs (all appeared valid) and dates from their respective PBBS. Also, the Packet duplicates had different answers. I frankly was expecting more duplicates from the Internet HTML version of the survey... Since this was a form type response, it would have been easier both to make an error and to just re-submit the survey. On Packet, users had to actually write a reply message and send a Packet message, a much more difficult process!

The only discarded reply looked to have been trashed by HF forwarding stations between the US and Western Europe. This one reply represents only 0.20% of the total and so has little impact on the survey.

Please see the OTHER INFORMATION GATHERED section for additional details that are interest.

SECTION 2 - ANSWERS

This section will look at each question and the answers received. The format for each each question will be the same:

Question Statement
Answers and number of replies
Discussion

QUESTION 1

What Packet BBS program do you use now, or if you are planning to set up a BBS in the future, what BBS program are planning to use?

F6FBB 103 (21.06%)
W0RLI 26 (5.32%)
AA4RE 21 (4.29%)
MSYS 73 (14.93%)
DOS/Windows NOS 75 (15.34%)
Unix/Linux NOS 29 (5.93%)
APLink 2 (0.41%)
CBBS 0 (0.00%)
G1NNA 0 (0.00%)
SV7AIZ 0 (0.00%)
TheBox 16 (3.27%)
UFQBBS 0 (0.00%)
WA7MBL 1 (0.20%)
WinLink 7 (1.43%)
XOBBS 0 (0.00%)
Other 22 (4.50%)
None 114 (23.31%)

TOTAL 489 (100.00%)

It should be made clear that these numbers are based only on replies to the survey and not on actual ditribution of the various software. In other words, there very likely are many more people using a particular software package than what is shown here.

It is assumed that the NONE answer are those that do not now and do not plan to operate a PBBS. This was a failure in the survey structure in that such an answer should have been available while, in fact, it was not.

In any event, two trends are clear: (1) F6FBB is the single most popular PBBS program and (2) The various NOS systems are, when totaled, even more popular.

QUESTION 2

How long have you operated a Packet BBS?

Less than 1 year 46 (9.41%)
1-2 years 82 (16.77%)
2-3 years 74 (15.13%)
3-5 years 58 (11.86%)
More than 5 years 51 (10.43%)
I don't run a BBS 178 (36.40%)

TOTAL 489 (100.00%)

The main information from this question is that about 1/3 of all respondants are not PBBS SysOps. This is about what I had expected when this started.

One interesting fact is that over 40% of our BBSs have been around 3 years or less with nearly 10% less than a year old. This shows a fair

growth rate and an attraction to new people to Packet.

QUESTION 3

If you are thinking of operating a Packet BBS, how long before you plan to your BBS on the air?

Less than 6 months 38 (7.77%)
6 months - 1 year 26 (5.32%)
1-2 years 12 (2.45%)
More than 2 years 3 (0.61%)
I run a BBS now 309 (63.19%)
I wouldn't run a BBS 101 (20.65%)

TOTAL 489 (100.00%)

This question again confirms that about 2/3 of the replies were from current SysOps. We also note here that about 15% of all current users are planning to move into being s SysOp in the next 2 years or less.

QUESTION 4

As a SysOp (or possible SysOp), what is the MOST important feature a BBS should have?

Easy set up 36 (7.36%)
Easy day to day operation 58 (11.86%)
Lot of features 19 (3.89%)
Telephone modem support 4 (0.82%)
Good documentation 127 (25.97%)
Author support 71 (14.52%)
Lots of add-on programs 8 (1.64%)
TCP/IP support 55 (11.25%)
Variety of TNCs supported 2 (0.41%)
I'm not a SysOp 109 (22.29%)

TOTAL 489 (100.00%)

Little of this surprised me as I had expected that Documentation, Author Support, and Easy Operation would be of prime importance.

One thing worth noting is the desire for TCP/IP Support. However, taking this in light of the number of SysOps using a NOS variant, this is not at all unusual.

QUESTION 5

As a SysOp (or possible SysOp), what is the LEAST important feature a BBS should have?

Easy set up 18 (3.68%)
Easy day to day operation 21 (4.29%)

Lot of features 36 (7.36%)
Telephone modem support 41 (8.38%)
Good documentation 4 (0.82%)
Author support 1 (0.20%)
Lots of add-on programs 92 (18.81%)
TCP/IP support 36 (7.36%)
Variety of TNCs supported 129 (26.38%)
I'm not a SysOp 111 (22.70%)

TOTAL 489 (100.00%)

The correlation between this question and Question #4 is good. Again, there were no real surprises here to me.

QUESTION 6

As a Packet User, what is the MOST important feature a BBS should have?

Good HELP systems 142 (29.04%)
ANSI support 25 (5.11%)
Other graphics support 42 (8.59%)
TCP/IP support 41 (8.38%)
Selective message reading 109 (22.29%)
File transfers 53 (10.84%)
White Pages support 47 (9.61%)
Multiple languages 9 (1.84%)
Other 21 (4.29%)

TOTAL 489 (100.00&)

I found two surprises here to my own preconceptions... (1) The relativly high number of users wanting file transfers (nearly 11%); and (2) The very low number of people wanting multiple language support (under 2%).

QUESTION 7

As a Packet User, what is the LEAST important feature a BBS should have?

Good HELP systems 22 (4.50%)
ANSI support 61 (12.47%)
Other graphics support 106 (21.68%)
TCP/IP support 87 (17.79%)
Selective message reading 25 (5.11%)
File transfers 27 (5.52%)
White Pages support 29 (5.93%)
Multiple languages 101 (20.65%)
Other 31 (6.34%)

TOTAL 489 (100.00&)

QUESTION 8

What type of network support is MOST important built into a BBS?

TheNET/NetROM 183 (37.42%)
ROSE 14 (2.86%)
TCP/IP 161 (32.92%)
Other 29 (5.93%)
None 26 (5.32%)
I don't know 76 (15.54%)

TOTAL 489 (100.00%)

It should be no surprise that TheNET and NetROM support is the leader here with TCP/IP functionality a close second.

It is interesting that more people were in favor of no network support than for ROSE support. While in my local area, ROSE never did catch on, I was under the imprssion that it was quite popular in some places.

QUESTION 9

What type of network support is LEAST important built into a BBS?

TheNET/NetROM 27 (5.52%)
ROSE 231 (47.24%)
TCP/IP 8 (1.64%)
Other 114 (23.31%)
None 2 (0.41%)
I don't know 107 (21.88%)

TOTAL 489 (100.00%)

This question supports the opinion that TheNET, NetROM, and TCP/IP support are favored while ROSE is considered not important.

QUESTION 10

If a Packet BBS that you really liked were available as a SHAREWARE program, how would you pay for it?

Less than $10 86 (17.59%)
$10 - $25 74 (15.13%)
$25 - $50 38 (7.77%)
$50 - $75 23 (4.70%)
More than $75 11 (2.25%)
I wouldn't pay 257 (52.56%)

TOTAL 489 (100.00%)

The results here are both surprising and a bit frightening. Please see Question 11 for more comments.

QUESTION 11

If a Packet BBS that you really liked were available as a COMMERCIAL program, how would you pay for it?

Less than $10 91 (18.61%)
$10 - $25 68 (13.91%)
$25 - $50 30 (6.13%)
$50 - $75 12 (2.45%)
More than $75 4 (0.82%)
I wouldn't pay 284 (58.08%)

TOTAL 489 (100.00%)

The results from this question and Question 10 do not bode well for BBS authors and for any company that wishes to publish a BBS program. There is good correlation between the two questions with the Commercial replies being slightly lower than for Shareware.

Several comments from responants stated that this is a hobby and/or this is Amateur Radio and no one should make a profit from the service. I wonder if this applies only to software or if Kenwood et al should not be selling radios?

The most frightening comments were several that stated that Hams are, in general, software pirates and that any Shareware or Commercial software would soon be spread world-wide to any Ham that would want it. One comment even stated that there is a "network" of Hams on the US West Coast that regularly give away Commercial software.

QUESTION 12

What operating system would you like to run a Packet BBS under?

MS-DOS or clone 145 (29.65%)
Windows 3.1 or 3.11 111 (22.70%)
Windows 3.x with Win32s 8 (1.64%)
Windows 95 122 (24.95%)
Windows NT 12 (2.45%)
Unix or Linux 48 (9.82%)
Apple Macintosh 13 (2.66%)
Commodore Amiga 3 (0.61%)
Atari ST/TT 1 (0.20%)
Other 26 (5.32%)

TOTAL 489 (100.00%)

Sadly, I had overlooked OS/2 when the list was set up. I presume that OS/2 makes up at least a good part of the Other responses.

The surprising thing here is that most folks are still using DOS vs a more sophisticated OS. With the availablility of Windows 3.x, Win32s, Windows 95 and NT, and Linux offering more power and flexibility than

DOS, one must wonder why so many are still using DOS. Perhaps this is related to the cost factors seen in Questions 10 and 11.

Also a bit surprising is the number of folks using a NOS variant and yet less than 10% are using Linux or Unix.

One thing that is clear is the relativly few people using some 680xx based computer. Only about 6% of all respondants use a non-Intel computer and OS.

SECTION 3 - OTHER INFORMATION GATHERED

This information, while interesting, does not really impact on the survey directly. Because of the nature of the supplimental data, it will be presented broken into two parts...

INTERNET REPLIES

Extra information from the Internet was gathered by means of JAVA, CGI, and HTML coding and found the following about respondants:

OS USED

DOS 24.05%
Windows 3.x 55.22%
Windows 95 12.53%
Windows NT 2.11%
Unix 0.30%
Linux 2.08%
Macintosh 3.52%
Atari ST/TT 0.07%
Other 0.12%

OS REPORTED CPU

8088/86 0.00%
80186 0.00%
80286 0.05%
80386 57.25%
80486 22.13%
80586 12.63%
80686 0.25%
68000 0.32%
68010 0.00%
68020 0.23%
68030 1.21%
Other 5.93%

OS REPORTED CLOCK SPEED

< 10 MHz 1.31%
10 - 20 MHz 16.58%
21 - 50 MHz 52.70%
51 - 75 MHz 19.22%
76 - 100 MHz 8.61%
101 - 150 MHz 1.13%
> 151 MHz 0.45%

WEB BROWSER USED

Netscape 1.x 11.03%
Netscape 2.x 18.66%
Netscape 3.x 0.23%
MS Explorer 1.x 13.62%
MS Explorer 2.x 9.51%
MS Explorer 3.x 0.58%
Mosaic Any 12.52%
Text Based 28.21%
Other 5.64%

Overall, this shows that survey respondants tend to use older computers (386 based) at relativly slow speeds (21-50 MHz) with Windows 3.x and a text based Web Browser.

This is a bit surprising to me... I had expected to see much more modern hardware in use.

PACKET REPLIES

The only item to report here is that it took, on average, 16 days for a private packet reply to reach my station.

SECTION 4 - OVERALL COMMENTS

First of all, I want to thank all of those that took the time to reply to this survey. It has provided some good information that, if nothing else, will generate a few flames and heated discussions in the Packet community!

Because of the correlations of many questions, I feel that, for the sample group, the data appears to be valid.

A few general conclusions can be made:

(1) F6FBB software is the most popular single program, but the NOS variants are coming on very strong.

(2) Most of our PBBS stations have been in operation less than 3 years.

(3) SysOps want and need good documentation and author support.

(4) Users want and need good online help systems.

(5) TheNET and NetROM are by far the most popular networks but TCP/IP is gaining rapidly.

(6) Most SysOps will pay little, if anything, for BBS software.

(7) DOS continues to be the most popular OS for BBSs.

What does all this mean? Like any survey, that is a matter of interpretation of the data and has a large personal bias component.

In general, we must ask why the results are the way that they are...

Why do we have so many new BBSs on the air? Is it because the "old timers" didn't bother to answer? If so, why not? Is this reality? If so, what happened to the older stations? Does this relative lack of experience have any impact on the Packet network in general? Good? Bad?

Why the strong outcry for good documentation and author support? Do SysOps feel that they are not now getting this? If so, why not? Is this tied to the position that most will pay little for software?

Why the growth in NOS and TCP/IP? Are these systems better than what we have now or is this just a passing fad? What benefits does TCP/IP and NOS offer as compared to traditional BBSs and vice versa? Is NetROM and TheNET doing what we need to be done or are they just hanging on based on tradition or simple distribution?

Why do users ask for good online help? Are they not getting that from current BBS programs? Do current programs have online help that is not set up correctly by the SysOp? Is this tied to the SysOp desire for good documents?

Why do SysOps appear to be unwilling to pay for software? Does current Shareware work? How much have the several authors collected so far? Since this is Amateur Radio, should all software be free? What about hardware? Are there really groups of Hams that distribute pirate software or are respondants just blowing off hot air?

Why are so many Hams using DOS when more powerful OSs are available? Is this tied to the unwillingness to pay for software and/or the apparant use of older, low end computers? Is this more a function of a lack of Windows and Unix based software for Ham use? Is this even a problem or concern at all?

I will leave the detailed interpretation of the data and the debate over its meaning to the masses. Please keep in mind that this is a VERY small sample and should in no way be taken to represent all Hams or even all Packet operators.

Again, thanks to those that answered the survey and thanks for reading these results.

5314. Bulletin Export Files Available

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-10-07 00:00:00 UTC
From: marty@trucom.com
Message-ID: <53a3pi$9b9@thepit.trucom.com>
Source record: 34210

Hello, Folks:

I now have Packet Bulletin Export Files available on my Home Page.

The files are split by distribution group. I now have the following available: ALLUSA, WW, EU, CANADA, ARRL, AMSAT, and NASA. Others may be added as needed.

Files will be posted daily and should be online after about Noon Central Time.

Just point your Netscape 3.0 or MS Inetrnet Explorer 3.0 browser at:

http://www.trucom.com/ppages/marty

and go to the Amateur Radio area. The rest should be clear to all.

NOTE: New export files by distribution are being added almost daily! Many thanks to all who are sending me their BBS exprts via attached E-Mail for inclusion!

Announcing NEW Ham Radio.FAQ

This file started as a regular USENET posting called "rec.radio.amateur
.misc Frequently Asked Questions".

The evolving file was distributed far and wide thanks to passionate
contributors. The file was abandoned in 1994 and has been resurrected
now on the WWW for currency and convenience.

Ham Radio.FAQ contains 3 chapters and many, many links to radio
related sites!

1 - Introduction to the Ham Radio.FAQ
2 - Amateur Radio Organizations, Services, and Data Sources
3 - Amateur Radio Advanced and Technical Questions

Please provide a copy of the Ham Radio.FAQ to any new or soon-to-be Hams
that you know or share with them the URL to this site:

Gary Coffman (gary@ke4zv.atl.ga.us) wrote:

: In article "J. Miner" <jminer@qed.net> writes:
: >
: >My County would like to put together a Packet Network for RACES, to link
: >all of the hospitals in the county to the Office of Emergency
: >Management. I am looking for software that will allow to have all of
: >the hospitals linked together back at the OEM. I would need it to pass
: >traffic and converse between all of these points. Does anyone have any
: >ideas? Thanks.

<snipped PacketCluster idea>

: Better would be to install a Linux system at each site, configure
: up a TCP/IP network among all the stations on packet, and use the
: ordinary unix and TCP/IP tools to converse and exchange messages
: and files, IE write, mailx, ftp, etc. You could even setup web style
: "chat rooms" for the various departments, though that could get ugly
: if you don't use fast packet links (I'd use 56 kb). All the packet
: and unix details could be hidden from the user by a nice menu system
: you could cobble together with shell scripts. That's the approach I'd
: take if the stations were to be permanently setup at the hospitals.

DOS versions of NOS (not sure about Linux, but it's likely) can also have
a facility called "converse" which is much like the CB simulator on
CompuServe, AOL's Chat Rooms, or <name escapes me> on the Internet. We've
had good luck keeping up with the converse feed from the Internet with our
network of 9600 baud repeaters in the Seattle area.

Best of all for the stated application, a central system can be the only
one running NOS or Linux- the remote units can just be AX.25 TNC's running
simple terminal emulation.

5317. Calling frequency for 2m packet?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-10-07 00:00:00 UTC
From: Rich Abbot <abbot@pez.bell-labs.com>
Message-ID: <3259432B.1228@pez.bell-labs.com>
Source record: 34213

The frequencies 144.200 and 146.52 are well-known
gathering spots for fans of point-to-point SSB and
FM communications on 2 meters.

Is there a corresponding frequency for 2m packet
ops to meet for keyboard-to-keyboard QSOs?

I've seen a few 2m packet frequency plans, and lots
of channels seem to be labelled "locally administered
simplex frequency," but none are identified as a
calling frequency for individuals.

I get the feeling that if I start sending UNPROTO CQs
on 146.52, I will not be a welcome addition to the
local FM simplex scene. I bet the same will be true
if I try to use some of the locally popular PBBS
frequencies like 145.03, .05, etc.

In 8 months of 2m packet, I have seen almost no
evidence of keyboard-to-keyboard operation.
Perhaps it's because I haven't been looking in the
right spot?

Thanks & 73,

Rich

If you delete it, Win95 will "find" it during the next bootup. Simply
uncheck it from the configuration and it will be ignored.

Hi N5ZGW,

I reply to your mail for information about portable Packet
Radio. I'm using a HP200LX, palmtop with a 5.00 DOS.
I'm used also a HP95 and HP100 but the best is the HP200 for the
compatibilty to a classical software. I've installed TCP/IP for test,
LanLink by G3ZCZ, Hyperlog for cluster, ... I'm using a TNC210 with
incorporate battery, and i've tested with a bad FT290 and a good
ICDelta1 tri-band and very good for dimension C108 by Standard.

This installation is very good for portable in the subway,
train, or in stay an OM in Cafe HI. If you want i can send to you a
photo about this with more information.

5323. APRS with?BayPac/BayCom or DSP Modem?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-10-07 00:00:00 UTC
From: wdr@world.std.com
Message-ID: <DyxI4J.61z@world.std.com>
Source record: 34219

This is probably a dumb question, since it falls between the
cracks of the available FAQs, I'll ask it in public.

Is it possible to use APRS with one of the packet drivers (?TFPCX?)
that works with the BayPac/BayCom modem kits? Or through a sound-card
DSP?

Yes, I know it's stupid to have the computer doing the bit assembley.
I'm not going to put it on the real computer. I just got a great deal
on a TNC, which I'll use with both APRS and normal packet, with both
the real computer and the main laptop and the calculator-with=serial-port.
But I'd like to lash something up real cheap for one of the
PC-boat-anchors lieing around to display APRS from the scanner,
read-only: kiosk-mode, using recycled computer and minimal modem.

It's been a couple of years since I was actively DXing , I used to use my DXbase logging software which monitored the 2M DX cluster for spots and alerted me to needed stations.

Now I see that I can telnet to the clusters, but does the state of the art allow clusters accessed via the Internet to be monitored by my logging software (any logging software) ????

5330. Packet radio login for Unix host

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-10-08 00:00:00 UTC
From: Matt Hamilton <mhamilto@albany.net>
Message-ID: <Pine.SUN.3.95.961008101139.21846A-100000@magik.albany.net>
Source record: 34226

Hi!
I am trying to set up some wireless system for being able to connect a terminal (a PC running terminal software) and a Linux server together. My main idea was to somehow use packet radio to link the two together, however I have some questions:

1) I am in England and I know Maplin and RS both make kit radios and walkie-talkies. Since I am just looking at a point-to-point system would it be possible to plug a packet modem into a high quality walkie talkie? The range I am looking at is under 1 mile. I was thinking about getting a kit walkie-talkie and a kit radio modem and put the two together in a box. This way I could probably avoid having to use a licensed channel (I don't have an amateur license).

2) Does anyone have any experience on plugging a packet radio rig into a unix system? I was thinking about just having it plugged into the serial port and trying to get a tty login, but I'm not sure if this is possible or not.

TIA,
Matt

Just give it a callsign, and set DIGI ON. MAXUSERS need not be set for unconnected digi-ing...that parameter is for the maximum number of connects to you/mailbox/node.

Take care.

I am interested in a similar idea... I just poseted a message here about trying to connect a terminal to a Linux box. via packet radio. As this is just intended for low range uses I was thinkn of using a walkie-talkie type radio (a kit built probably) so I wouldn't need to get a license.

I want to know more about how this would work. Would I use straight AX.25 or would I be able to use TCP/IP. If I was just using AX.25 (as you mention above) then how are network addresses assigned? Are they just the station's callsign? What needs to be added to the Linux machine? I assume some sort of TNC and a modem and radio - are there any particular one's that you'd recommend?

TIA,
Matt

Hello.
I've just updated my FTV program, which does FAX & SSTV using a SoundCard, to decode Baudot using the same (FM) demodulation engine.

Here is a run down of the more interesting features:

(1) It keeps the demodulated signal in memory, so that the signal can be analysed again at a different keying rate or polarity! Garbage can be resampled on the fly, which means that minutes of received signals decoded at the wrong baud rate or keying polarity are recovered, on the fly, while still receiving.

(2) Keying rate and polarity are analysed automatically - standard baud rates are automatically set following analysis.

(3) Tuning oscilloscope available at all times, without loss of copy.

(4) Program works in real time.

(5) I wrote it, and I love it - I myself can't believe it works so well!

Download your copy of FTV from my web site, at:
http://www.geocities.com/SiliconValley/2504

System requirements, and the standard features of FTV are described in the following page:
http://www.geocities.com/SiliconValley/2504/ftv.htm

By the way, AM signals from low orbiting weather satellites are also decoded - no extra interfaces needed. Demodulation mode is user selectable in software.

Hope you all have a load of fun receiving 'words and pictures' - I hope to get some feedback !

All the best from Brian, 9H1JS, on the Island of Malta.

pickle.n2wx.ampr.org is connected this way with a TNC-2 on one serial
port. It's also my router so it does double duty.

Unfortunately it is not plug and play for amateur service: Most
human-oriented packet ops use a lone carriage return for end of line
(converse mode). This is a TTY option not available out of the box
under either linux or freebsd (maybe others don't have this problem)

Fortunately it's a simple kernel hack for either of those boxes to
force newline as \r instead of \n or \n\r. ANd this isn't a problem
if you don't have to worry about interconnectivity.

The easiest install was with FreeBSD. Tweak the kernel tty.c as
mentioned above, set an option in rc.serial, plug the TNC in, and go.
Linux needed a bit more handholding but also worked well enough when
I was still running that o/s

Am guessing Howard used the TNC as if it were a modem for login? Then
either the TNC could have mapped <CR><LF> correctly, or getty could
have been told to fix it on the Unix side, or (worst case) the user
could have detected the incoming login was on the TNC serial port and
could have forced the desired settings with stty in their ~/.login
(or is it ~/.profile for bash users?)

I don't understand the complexity of a kernel hack for \r\n. Seems to
me you need to deal with echo also.

What's about Linux 2.* and axspawn program from new users ax25-utils.
Is there the same problem with CR ? I not upgrade to 2.0 yet, but
how I understand from HOWTO, we don't need use hack ax25login.
If you use axspawn for login on Linux PC on air and this work, PSE
let me know.

Hmmm. Perhaps it's because many of us give up 'keyboard-to-keyboard'
packet operation after the new wears off. But, packet radio
shares a frequency. Go ahead and try raising someone on the
"PBBS frequencies". You might try monitoring and just connecting
with a station after he disconnects from a PBBS.

Good luck,
Mike, K0TER

I don't believe there would be a problem as it doesn't use a getty.
In my conf the TNC looks like a dumb auto-answer modem while the linux
AX25 drivers if I'm not mistaken create a TCP-IP capable device out of
the TNC.

5346. Help re simplex mode for high speed modem

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-10-09 00:00:00 UTC
From: "T.A.Holden" <tholden@toronto.cbc.ca>
Message-ID: <325BD767.5131@toronto.cbc.ca>
Source record: 34242
Cross-posted to: comp.modems,rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Is it possible to setup a modem through the AT commands to transmit at high data rate in the absence of a receive carrier? I have succeeded at low data rate (300 bps) using analog loopback followed by digital loopback but cannot force a higher data rate.

Any ideas? Would appreciate e-mail and others may want posting. Thanks.

No. Highspeed modems talk to eachother at connection setup, and measure
the line characteristics to compensate for frequency and phase characteristics.
This is the warbling noise that you hear before CONNECT appears.

So, you can only use a highspeed modem on radio (I suppose that is what
you are after) when the radio path is fullduplex so the modems can hear
eachother all the time. And even then it probably won't work too well,
because a radio path has distortions (due to multipath, changing propagation
etc) that a telephone modem is not designed to cope with.

5352. Linux AX-25 question

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-10-10 00:00:00 UTC
From: jdc@cci.com
Message-ID: <Dz1FvA.DuM@sunsrvr6.cci.com>
Source record: 34151

I'm having poor luck with axattach from ax25-utils-2.0.12. The command:

axattach -i 44.69.128.51 /dev/ttyS1 144

gives:
axattach: SIOCSIFHWADDR: Invalid argument

This comes from setifcall() in axattach.c:
if (ioctl(fd, SIOCSIFHWADDR, call) != 0) {
close(fd);
perror("axattach: SIOCSIFHWADDR");
return FALSE;
}

The value of 'call' is a mangled value derived from 'N2VNO-1' by
convert_call_entry(). Running gdb with source compiled '-g' shows
it as a bunch of non-printing characters.

All this is on a Slackware 3 install, a 2.x kernel.
Any suggestions?

: it..? or have any web site where to find it..?

Don't do it!! The PCS-2000 is probably the worst rig one can use on
packet. It has a very long PTT-> TX delay, and it sweeps a signal
across the band during that keyup time.

No. Highspeed modems talk to eachother at connection setup, and measure
the line characteristics to compensate for frequency and phase characteristics.
This is the warbling noise that you hear before CONNECT appears."

Good point. So a forced connect speed does not preclude this negotiation?

Is there not some test mode with which the modulator can be used at high speed
without detection of remote carrier and negotiation?

" So, you can only use a highspeed modem on radio (I suppose that is what
you are after) when the radio path is fullduplex so the modems can hear
eachother all the time. And even then it probably won't work too well,
because a radio path has distortions (due to multipath, changing propagation
etc) that a telephone modem is not designed to cope with."

Agreed. However, I am thinking of using a stable, high quality but unidirectional voice
(or wider) channel.

From: wdr@world.std.com
Subject: APRS with?BayPac/BayCom or DSP Modem?

This is probably a dumb question, since it falls between the
cracks of the available FAQs, I'll ask it in public.

Is it possible to use APRS with one of the packet drivers (?TFPCX?)
that works with the BayPac/BayCom modem kits? Or through a
sound-card
DSP?

Yes, I know it's stupid to have the computer doing the bit
assembley.
I'm not going to put it on the real computer. I just got a great
deal
on a TNC, which I'll use with both APRS and normal packet, with both
the real computer and the main laptop and the
calculator-with=serial-
port.
But I'd like to lash something up real cheap for one of the
PC-boat-anchors lieing around to display APRS from the scanner,
read-only: kiosk-mode, using recycled computer and minimal modem.

From: Rich Abbot <abbot@pez.bell-labs.com>
Subject: Calling frequency for 2m packet?

The frequencies 144.200 and 146.52 are well-known
gathering spots for fans of point-to-point SSB and
FM communications on 2 meters.

Is there a corresponding frequency for 2m packet
ops to meet for keyboard-to-keyboard QSOs?

I've seen a few 2m packet frequency plans, and lots
of channels seem to be labelled "locally administered
simplex frequency," but none are identified as a
calling frequency for individuals.

I get the feeling that if I start sending UNPROTO CQs
on 146.52, I will not be a welcome addition to the
local FM simplex scene. I bet the same will be true
if I try to use some of the locally popular PBBS
frequencies like 145.03, .05, etc.

In 8 months of 2m packet, I have seen almost no
evidence of keyboard-to-keyboard operation.
Perhaps it's because I haven't been looking in the
right spot?

Thanks & 73,

Rich

of
: >the hospitals linked together back at the OEM. I would need

it to pass : >traffic and converse between all of these points.
Does anyone have any : >ideas? Thanks.

<snipped PacketCluster idea>

: Better would be to install a Linux system at each site, configure
: up a TCP/IP network among all the stations on packet, and use the
: ordinary unix and TCP/IP tools to converse and exchange messages
: and files, IE write, mailx, ftp, etc. You could even setup web
style
: "chat rooms" for the various departments, though that could get
ugly
: if you don't use fast packet links (I'd use 56 kb). All the packet
: and unix details could be hidden from the user by a nice menu
system
: you could cobble together with shell scripts. That's the approach
I'd
: take if the stations were to be permanently setup at the
hospitals.

DOS versions of NOS (not sure about Linux, but it's likely) can also
have
a facility called "converse" which is much like the CB simulator
on CompuServe, AOL's Chat Rooms, or <name escapes me> on the
Internet. We've had good luck keeping up with the converse feed
from the Internet with our network of 9600 baud repeaters in the
Seattle area.

Best of all for the stated application, a central system can be
the only one running NOS or Linux- the remote units can just be
AX.25 TNC's running simple terminal emulation.

If you delete it, Win95 will "find" it during the next bootup.
Simply uncheck it from the configuration and it will be ignored.

Subject: Packet radio software for windows in comb. with baycom
modem

Hello,

Is there on the net software available to use a Baycom interface
unther windows 3.11.

Does any one know if the baycom Inferface can be used to for other
purposes as well (rtty,fax,CW ect.ect.ect) and if it does where can
i
find the software?

Thanks for the reply's

Subject: Palmtop for Packet Radio ---> RE:N5ZGW

Hi N5ZGW,

I reply to your mail for information about portable Packet
Radio. I'm using a HP200LX, palmtop with a 5.00 DOS.
I'm used also a HP95 and HP100 but the best is the HP200 for the
compatibilty to a classical software. I've installed TCP/IP for
test, LanLink by G3ZCZ, Hyperlog for cluster, ... I'm using a
TNC210 with
incorporate battery, and i've tested with a bad FT290 and a good
ICDelta1 tri-band and very good for dimension C108 by Standard.

This installation is very good for portable in the subway,
train, or in stay an OM in Cafe HI. If you want i can send to you a
photo about this with more information.

Subject: Cluster-logbook interface on internet?

It's been a couple of years since I was actively DXing , I used to
use
my DXbase logging software which monitored the 2M DX cluster for
spots
and alerted me to needed stations.

Now I see that I can telnet to the clusters, but does the state of
the
art allow clusters accessed via the Internet to be monitored by my
logging software (any logging software) ????

On 7 Oct 1996, Steve Stroh wrote:

> Best of all for the stated application, a central system can be
the only > one running NOS or Linux- the remote units can just be
AX.25 TNC's running > simple terminal emulation.

I am interested in a similar idea... I just poseted a message
here about trying to connect a terminal to a Linux box. via
packet radio. As this is
just intended for low range uses I was thinkn of using a
walkie-talkie
type radio (a kit built probably) so I wouldn't need to get a
license.

I want to know more about how this would work. Would I use
straight AX.25 or would I be able to use TCP/IP. If I was just
using AX.25 (as you mention above) then how are network addresses
assigned? Are they just the station's callsign? What needs to be
added to the Linux machine? I assume some sort of TNC and a modem
and radio - are there any particular one's that you'd recommend?

TIA,
Matt

From: Matt Hamilton <mhamilto@albany.net>
Subject: Packet radio login for Unix host

Hi!
I am trying to set up some wireless system for being able to
connect a terminal (a PC running terminal software) and a Linux
server together. My
main idea was to somehow use packet radio to link the two together,
however I have some questions:

1) I am in England and I know Maplin and RS both make kit radios
and walkie-talkies. Since I am just looking at a point-to-point
system would it be possible to plug a packet modem into a high
quality walkie talkie? The range I am looking at is under 1 mile.
I was thinking about getting a kit walkie-talkie and a kit radio
modem and put the two together in a box. This way I could
probably avoid having to use a licensed channel (I don't have an
amateur license).

2) Does anyone have any experience on plugging a packet radio rig
into a unix system? I was thinking about just having it plugged
into the serial

port and trying to get a tty login, but I'm not sure if this is
possible
or not.

TIA,
Matt

What's about Linux 2.* and axspawn program from new users
ax25-utils.
Is there the same problem with CR ? I not upgrade to 2.0 yet, but
how I understand from HOWTO, we don't need use hack ax25login.
If you use axspawn for login on Linux PC on air and this work, PSE
let me know.

pickle.n2wx.ampr.org is connected this way with a TNC-2 on one
serial
port. It's also my router so it does double duty.

Unfortunately it is not plug and play for amateur service: Most
human-oriented packet ops use a lone carriage return for end of line
(converse mode). This is a TTY option not available out of the box
under either linux or freebsd (maybe others don't have this problem)

Fortunately it's a simple kernel hack for either of those boxes to
force newline as \r instead of \n or \n\r. ANd this isn't a problem
if you don't have to worry about interconnectivity.

The easiest install was with FreeBSD. Tweak the kernel tty.c as
mentioned above, set an option in rc.serial, plug the TNC in, and
go.
Linux needed a bit more handholding but also worked well enough when
I was still running that o/s

Am guessing Howard used the TNC as if it were a modem for login?
Then
either the TNC could have mapped <CR><LF> correctly, or getty could
have been told to fix it on the Unix side, or (worst case) the user
could have detected the incoming login was on the TNC serial port
and
could have forced the desired settings with stty in their ~/.login
(or is it ~/.profile for bash users?)

I don't understand the complexity of a kernel hack for \r\n. Seems
to
me you need to deal with echo also.

> AT compatible (or other) modems.

If the Hayes has "FAX" modes, try them. Like V.29 or something. I've
done
amateur radio links
using v.29 (which is the standard 9600bps mode) and it works fairly
well.
You'll need to use fairly long txd's.... something on the order of 400ms
due to the train sequence it sends, but other then that it works well.
You will need to make sure you audio is not clipping however as V.29
is 16 level QAM. The train sequence is (I think) about 250ms plus
another 150ms for the radio to stabilize. There is a fast train mode
you can use which is only 50ms long.

V.29 is a half duplex data modem standard. Center carrier is
1800hz. Some of the results I had got written up in QEX and
TAPR PSR a number of years back. Also, the Japanese have
done some work with this as well. They (I think) were using
the Rockwell chip set... I was using the Yamaha chip. I little
write-up is on the PRUG homepage (sorry, don't know the URL).
They (the Japanese) have also done some work with V.27 (7200bps)
which is a little more robust in a radio enviroment then V.29.

I've not tried the 14.4 fax modes.

>
> Agreed. However, I am thinking of using a stable, high quality but unidirectional voice
> (or wider) channel.
>

On slowly "fading" channels, you shouldn't have much problem assuming
you re-train
frequently. Actually, its been my experince that a radio channel is

better in most
cases then a telephone channel. Now, I am talking about a properly
engineered link
with clearences in the fresnel zones. This of course is a VHF/UHF link,
not HF or
some "HT" style rubberduck packet station.

Good luck

> No. Highspeed modems talk to eachother at connection setup, and measure
> the line characteristics to compensate for frequency and phase characteristics.
> This is the warbling noise that you hear before CONNECT appears."

>Good point. So a forced connect speed does not preclude this negotiation?

No, it doesn't. Speed negotiation is only a very small part of this
process. The remainder is referred to as "training" and needs to be done.

>Is there not some test mode with which the modulator can be used at high speed
>without detection of remote carrier and negotiation?

Training is always required in these multi-phase multi-level modulation
schemes. Even FAX modes, which are largely unidirectional, use training.
A slow (300 bps) fullduplex negotiation phase is used to coordinate the
training, the remainder of the transfer is unidirectional.

>Agreed. However, I am thinking of using a stable, high quality but unidirectional voice
>(or wider) channel.

To use standard telephone modems you will need a backward channel.
When you design everything from scratch (or: at least the operating firmware)
you might be able to come up with some protocol that does the training
with only a single direction.

Hi everyone,
I have been using a DPK-2 TNC made by DRSI for three years and
have been very happy with it but have just run into a snag. My computer
died and when I switched from the old BEEB to a PC all I get are greek
characters (Log on is genuinely lambda omega etc!). Am I doing something
stupid? Alternatively is there a UK agent for DRSI?

In anticipation,
73,

5366. Video From Field to Classroom

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-10-10 00:00:00 UTC
From: rwhiting@winternet.COM
Message-ID: <199610100004.TAA16990@icicle.winternet.com>
Source record: 34247

I'm posting the following message from the EDTECH mail list in the hope that someone here might be able to suggest a suitable wireless technology for the air link, e.g., one of the Part 15 spread spectrum products.

Date: Tue, 8 Oct 1996 08:44:51 EDT
From: Rob Ross <serross@sci.shizuoka.ac.jp>
Subject: Possibility to send real-time video from field to classroom?

I have been searching the literature for a way to broadcast nature into the classroom, but the closest I've come is teleconferencing from a laboratory setting. I would greatly appreciate any advice anyone may have on this. [I apologize for any cross-postings you may have received.]

A bit more explanation:
I am looking for a way to send a video signal from a remote location -- i.e., outdoor settings (e.g., forests, beaches, anyplace...) -- to a classroom. One teacher would go into the field with a camera, and communicate with (and be directed by) another teacher and students in a class. The purpose would be to get students in contact with the field on a very regular basis when field trips are unfeasible -- and enable the advantages of interaction within a classroom.

The video would only need to go one way of course; the teacher in the field need only receive audio. My needs sound like those of a news broadcast, with an anchor and someone reporting from location. But I imagine that the technology, such as satallite links, would be unavailable for individual classes.

I wonder if it is possible to send a good video signalfrom a remote location that could be picked up by modern videoconferencing technology. A couple of suggestions I have had (but that hadn't actually tested): (1) taking a wireless modem and laptop computer with internet videoconfercing software into the field, so long as receivers/transmitters are not too far away, or (2) using a cellular telephone, cellular modem, and laptop with phone-based videoconfercing software. I also found a company called KaStar that intends to use a "Ka band satellite transmission system" for low cost, on demand, interactive videoconfercing, etc. This would work, but it'll be several years before it's in operation, and I wonder how low cost it'll really be.

I would be very grateful if anyone any advice about or experience with this sort of system.

Thanks.

Sincerely,
Rob Ross

WEll.. I put my tap at the junction of D02 and D03. It works
with the MFJ 9600 baud modem. But the throughput is not that great.
I tried putting an op amp to boost the level, but that did not really
help. It basically works, but the error rate is higher than I like.
I am thinking of getting a TEK radio to dedicate to packet.

Hi,
There is a company that sells software for the CP-1 and other older TTY boxes without a computer. It uses some noise reduction algoritym and costs around $100, you may have to go back 1-2 years in QST to find an ad.

I bought a CP-1 also. It needs software that will run at the baudrates used by the teletype etc. you are looking at (eg 60 wpm etc.). I modified the hardware of my old CPM machine to divide the standard 19200 baud clock by some integer to closely match the clock. I then wrote a teletype program.

You may be able to do the same by connecting the serial in/out to the DTR/DSR lines of your PC and writing code to poll them if you are inclined to write software and not to spend the money. I'd spend time working on making the thing fairly insensitive to noise. The PC-1 is supposed to have good filters, and you can move the mark (or space?) tone around with a knob. I think it will work at up to 300 baud, but is best for teletype/amtor.

Before connecting it to a PC make sure you have the 75123? type interface chips that convert the TTL (5V) logic to RS-232. I couldn't find any (obsolete) and the good people at AEA sent me a set of IC's for free.

>

I'd have to agree. One way to check for sure is to do a "loop back"
test. To do this, he does the following:

1) disconnect the radio from the TNC (entirely!)
2) connect the RX audio pin to the TX audio pin on the back of the
TNC. I beleive the PK-12 uses the almost-standard 5-pin DIN
connector, so it's a matter of connecting pin 1 to pin 4. These are
right next to eachother, and a piece of 14- or 16-gauge wire bent into
a "U" shape will do the job.
3) Set the TX audio pot to mid-range. Make sure that the TX level
jumper (which I beleive this TNC has inside) is set to the high level
position.
4) Issue a connect command to the same call he has programmed into
the MYCALL command.

If the TNC is working, he'll get either a CONNECTED message or a BUSY
message, depending on wether the TNC is set up to support multiple
connects.

If that works, he needs to review cable wiring, and perhaps get out
the ohm meter and verify all connections from end to end of the cable.

Also, AEA has a web site, which has wiring diagrams for most models of
radios. To my knowledge, all of these were correct, when I did them
(when I worked at AEA) about 2.5 years ago. The home page is
"http://www.aeainc.com/". Look on the Technical Support page for the
link to radio hookup information.

Hope that helps!

73, Bob

I use BMKMULTY written by G3BMK I believe. It's available in the US from Spheretron, formerly Schnedler Systems. They advertise in some of the ham magazines. The software is modular, with modules for RTTY, AMTOR, PACTOR, CW, SSTV and Spectrum Analyzer. I've only used the RTTY/AMTOR/CW and PACTOR modules and have been pleased with them.

Be aware that CW copy of anything but machine sent cw is pretty problematic - some fists are pretty poor. It seems to do about as well as other automated cw readers (PK232, KAM), but none of them are terribly good except on machine sent code.

The manual tells you how to modify the CP-1 to work with the program, you reroute a couple of pins on the RS232 port to use handshake lines for PTT and stuff like that. Took about 20 minutes.

There may also be shareware software available various places, but I have no leads on that. Since I started using this software, I sold my old PK232 and just use the CP-1. (and recently got a HAL 6000 which is great for receive, but the FSK output is currently busted...) The nice part about using the BMKMULTY code is that you can use it on several of *your* computers (it's coded to your callsign) and upgrade your modem as better things come along (like the ST6000). I use it with a CP-1 or the ST6000 at home, and off a laptop with an old Kantronics modem mobile/portable - two for the price of one! :-)

Hope that helps. I don't have a ham magazine here that has the ad in it, but searching the web for spheretron I found this under a commodore supplier - looks to be the same place

Telephone modems faster than 2400 baud go through a training and
negotiation phase at connection startup. This can't be bypassed by
an AT command. However you can use what is called a "short haul"
modem. These are designed to operate over leased lines and expect
a consistent EQ, hence they don't train and negotiate. Immac carries
several brands of these short haul modems. 9600 baud units are common,
and fairly cheap, faster units are available. They expect a 4-wire
interface, thus they should work on a good voice grade radio circuit.
(They can't deal with multipath, however.)

It *is* possible to force a Group 3 FAX modem to work on the radio
channel. There is a test mode for some of these which allows them to
go on-line without training. This can give you 9600 baud data. Some
amateurs in Japan experimented with this for a while. It's not an
AT command, however, you have to actually strap pins on the modem
chip to put it in test mode.

For robust operation on a radio circuit, you really need a radio
modem. And for speeds over 2400 baud, you really need a data radio
and not a voice radio kludge. Not only does this work better, it's
usually cheaper too.

Since packet is an inherent frequency sharing system,
it is not common for separate frequencies to be assigned
for different usages. The normal practice is to assign
frequencies on a geographical basis (called LANs) with
every station in that geographic area operating on that
frequency, regardless of the type of packet activity being
performed. And stations *stay put* on that frequency so
the network can find the station should another station
wish contact. (It's not a network if stations keep hopping
from frequency to frequency and pop up willy nilly in
various parts of the network topology at will.)

Each LAN then has a node or switch which can be used to
route packets via a backbone frequency to another LAN
when desired. The backbone frequency is separate from
the LAN frequencies. The switch has two radios, one on
the LAN frequency and the other on the backbone frequency.

The switches *route* packets from one LAN to another by
methods which depend on the sort of networking system
used in your area. There are a number of networking

schemes in use, from the fully manual source routed
KAnode to the semiautomatic Netrom to the fully automatic
TCP/IP network. You'll have to consult with the local
networking gurus to find out what is used in your area.

To recapitulate, you do *not* frequency hop on packet.
You stay on your assigned channel and let the network
route your packets as required to reach other stations.
It doesn't matter if you want to keyboard chat or transfer
a file or retrieve Email. That's all done on the same
LAN frequency thanks to the channel sharing inherent
to packet and the routing provided by the network.
(This is why crystal controlled radios work so well
for packet. No frequency agility is required at all
by the user.)

Now that's the way packet is *supposed* to work, and the
way it *does* work in a well designed system. However, in
some areas, packeteers haven't done a good system design,
or are using very low speed channels with low capacity.
In these cases, you may find that different frequencies
have been set aside for different purposes, usually with
one channel as the BBS channel, another for local station
to station activity, and perhaps a third for digi Dxing.
This is a horrible way to do things, and doesn't exploit
the power of packet or networking well at all, but if
that's what's being done locally, you'll have to live
with it until you can change it.

To find out how things are done in your area, and what
frequency (or frequencies) you should use, you have to
ask the locals. Packet is by nature a *cooperative*
activity by a *group* of stations. To function properly,
you need to be a coordinated part of the group.

Source record: 34175

My PK88 has developed an interesting deafness problem, and
I wonder if anybody knows how to cure it. After working
nicely for weeks on end, the DCD light goes out for awhile,
sometimes hours. Then it begins to flicker, comes on, and stays
lit with no incoming audio. I have disconnected all cables except
12v power, but it stays on. Some power cycling sometimes fixes it
for awhile, but not too permanently.
The 12 volts is fine, there's 5v coming off the regulator chip,
and I have a fan on to keep it cool. Even with the fan off, and
no radios or computers on, it occurs.
I have the latest ROM from AEA in it. Let me know if you
have any ideas what I could look for. TIA. -pat

Hi Folks

I just purchased a pair of EF Johnson 2400 MHz SS Wireless LAN transceivers (Model DL-3480) at a fleamarket. Does anyone on here have any experience with these units or alternatively with similar 1/2 watt part 15 SS 2400 MHz units. Especially in regard to expected distance with typical antennas, effects of foliage, etc.

Thanks

Burt, VE2BMQ

Any used PK232's out there. I need one if price is right. I realize
I need the special cable for the CBM128 that converts the RS232 port
to work with the PK232's. I have that already.

From: nbargman@fullnet.net
Message-ID: <325eea90.0@206.103.97.91>
Source record: 34183

Marty, as one of the respondents to the survey, I did add additional comments. Are there any plans to provide excerpts of these comments which may shed a bit more light on the survey?

Personally, I found the results interesting and it basically confirms some of the observations I've made. I do agree with Gary's assessment of Linux, which I've started playing with. Yes, there is a learning curve, as there is with anything new or unfamiliar. However, many things are happening in the Linux camp and I expect in a year or two a lot of development effort will be made by ham programmers as hams realize the stability and flexibility Linux provides over DOS and its kin.

Hello, Folks:

I have just put up my new home page and invite all to drop in for a look. Included at the site are the following areas:

Ham Radio -- Mostly packet, mostly high speed

Pipe Smokers -- Very, very much still under construction

Astronomy -- Mostly Amateur Radio Astronomy (good 2nd interest for Hams!)

Mapping -- Mostly about elevation maps

Heartland Internet Services -- Lots of Web Presence information

The URL to use is:

http://www.trucom.com/ppages/marty

Thanks!

Take Care & 73

They are old enough by now to be getting near the age when the keep-alive
battery is going to fail! I realize that ought to make no difference when
there is power on in the circuit, BUT, there are several ways that a cell
can fail, including short out. Just by accident, it may be possible that
a failure in it can load some other circuit in the logic end so that it
produces an unstable board?

Just a wild thought!

Another way to find these creatures is to get a can of chill it, or these cans
of compressed whatever for dusters can also be used. You'll have to invert
the duster to get liquid, but squirting a little on each IC and component to
chill it will tell you right quick if any of them are breaking down under
heat load! When you hit the right one, presto, boad goes back stable again.

Source record: 34190

Hi,

Is there any way to modify a TNC2C-modem to do 38400 baud in the
serial-line in to the computer ? I am running 9600 baud in the air,
and 19200 baud to the computer is to slow for WA8DED-hostmode with
FBB. It happends very often that the remote station will have to wait
for my modem to get space for incoming data in the buffer.......

I have heard about some OH-stations that made such a modification, but
as I understood the modem burned up.....hi (they had put a higher
crystal in it, I think).

Pse answer both news and email !

They don't do any which don't require an amateur radio licence. They can't
do ones that require a commercial licence, as you, as a constructor, will
not be able to get them type approved and would have to pay many times the
price to have them approved on a one off basis - and if you are able to
do that, and the useage is compatible with amateur radio use (reading
USENET in the UK is not) you will have no trouble in passing the exams
anyway.

>it be possible to plug a packet modem into a high quality walkie talkie?
>The range I am looking at is under 1 mile. I was thinking about getting a

At that distance you will need a licence of some sort. You will almost
certainly find that that licence only permits voice.

>kit walkie-talkie and a kit radio modem and put the two together in a box.
>This way I could probably avoid having to use a licensed channel (I don't
>have an amateur license).

No it wouldn't.

Note there are some licence free telemetry transmitters, but 1 mile is
a bit far for them.

The UK is very densely populated, so proper licensing and frequency
coordination are needed to prevent mutual interference at even quite
short distances.

The other issue is that the government firmly believes in privatisation of
the radio spectrum, so any use that is commercially valuable is liable to
attract licensing fees in proportion to that value. If you are merely
trying to avoid phone charges, the license ought to cost around the cost
of those phone charges.

Cross-posted to: rec.ham-radio,rec.ham-radio.packet,rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.shortwave,rec.radio.swap

Hello, I am considering to buy a PACTORII unit from SCS GBMH, the PTC-2

See for more information:

http://www.scs-ptc.com/pactor2.html

From this URL I got my information, what I am trying to figure out is if it is really is the very robust digital communication method that they claim it to be, or if it is just another sales pitch.

After all, $900+ bucks is not cheap.

Is there any-one out there that has bought this TNC? What are the experiences?

What are the chances that pactor-II might be licensed out to other manufacturers TNCs like AEA?

Thanks,

Loek d'Hont ldhont@ti.com

5399. PacComm SPIRIT2 Problem

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-10-13 00:00:00 UTC
From: w6go@netcom.com
Message-ID: <w6goDz7Eq7.EuC@netcom.com>
Source record: 34194

I have FOUR PacComm SPIRIT-2 (well, actually, one is a SPRINT-2 but thats another story) TNCs on my bench. They have various firmware chips, including X1J. They all exhibit the same problem. I have the transmit audio not-gated with PTT (JP8 2-3) so with a scope I can see the G3RUH eye-pattern signal at the radio jack's transmit audio pin at all times.

When I turn the 12v on, using the front panel switch or externally connect 12v with the front panel switch on, the transmit audio waveform usually does not start up. To get the transmit audio running, I momentarily interrupt the 12v and then all is fine.

The clocks all come on ok, but the G3RUH chips do nothing until the power is "glitched" and then they work fine. I've seen problems with other SPIRIT-2s before that have been corrected by turning the power off and back on, but now I understand what is happening. I question the use of these TNCs at a remote site now, as if the power is interrupted and then restarted, the G3RUH transmit data may not start!

Anyone else ever seen this condition? Any ideas? There is **NOTHING** at PacComm's web page or on PacComm's ftp site about any kind of technical problems on ANY ProComm gear.

Macintosh users have a public domain freeware program called Net/Mac.

You can go FTP it per the following or alternatively, you can send me
a disk with SASE and I'll send you the latest version plus companion
Mac files and info you'd probably find useful.

* NET/Mac is an application, that has been created for ham-radio operators.
* It can be used to hook up a Macintosh to the amateur-radio 'packet-radio'
* wireless network. NET/Mac supports the TCP/IP protocolstack.
*
* If you want to get acquainted with TCP/IP over packetradio, then I suggest
* you read the book: NOSintro, TCP/IP over Packet Radio. It has been written
* for the PC world but PC's and Macintoshes mix well in this area. The author
* of the book is Ian Wade, G3NRW, ISBN: 0-897649-00-2.
*
* To use NET/Mac you need:
* a) a ham-radio license
* b) a transceiver connected to an antenna
* c) a TNC that supports the KISS protocol
* (A TNC is like a modem... A modem however drives a telephoneline, while
* a TNC drives a transmitter and receiver...)
* d) a Macintosh 512 or newer
* e) a complete working environment for NET/Mac, which consists of directories
* for mail, logfiles, an example of autoexec.net and some more configuration
* (example-)files.
* Also you need Ivo ON1XK's mailer (IM/Mac).
* Usually you can download both the environmentfile as well as IM/Mac from
* the same place you downloaded NET/Mac from. Look for the files that carry
* names like: 'IM_Mac_<verion-number>.sea.hqx' and 'radio-config.sea.hqx'
* (also seen around as: radio-environment.sea.hqx). Sometimes even the word
* 'radio-' isn't there.
*

```
* New versions ususally get downloaded to:
* - sumex-aim.stanford.edu (directory: info-mac/comm)
* - ftp.ucsd.edu (directory: pub/hamradio/packet/tcpip/incoming)
*
* History
* =======
* The application NET/Mac, was ported (from Phil Karn's NET) to the Mac
* by Dewayne Hendricks, WA8DZP.
*
* This release is based on Dewayne's NET/Mac 2.0 and contains all mods of
* the newer NET/Mac 2.2. Both NET/Mac 2.0 and 2.2 were released by Dewayne
* Hendricks and Doug Thom. Since some time I have been making mods (bug-
* fixes and enhancements) to their NET/Mac, and have always sent them these
* mods. Now that they are working on a new application, that will support
* high speed networks and will also support AppleTalk over that network,
* they have given me permission to distribute their NET/Mac with my mods
* installed.
*
* I hope you'll like the work I have done so far, and I will try to keep
* 'upgrading' this application as much as possible. Don't bother Dewayne
* or Doug in case you have problems or questions. Don't hesitate to call
* me if any help is needed. I will try to be as helpful as I can. If you
* want to become member of a 'NET/Mac distributionlist' (I myself prefer
* internet for sending out newer versions...) then please leave me a note.
* I may start sending out UpdateMaker documents that will allow you to
* update NET/Mac to a newer version as soon as one has become available.
*
* I'd like to thank Dewayne and Doug for the sources they gave me to work
* on and Joe AF2J for already sending me a number of mods.
*
* Adam van Gaalen, PA2AGA.

I be konfuzed.

I am trying to get started on packet TCP/IP. I have a local PBBS with the appropriate capabilities and I have a registered IP address and all that, but I am confused by the different software packages that are available.

I've got WNOS and JNOS and PA0GRI. Before I start climbing up the learning curve on one of these packages, could someone tell me how they differ and if one of them is somehow better than the others?

Thanks very much.

: Art.Jeyes@jhuapl.edu
: Art Jeyes -- AA3GU

Art,
You sent me back to the "drawing board". I hooked two SPIRIT-2's
together and made sure they were talking to each other ok. Then I put a
dual-trace scope on their outputs and turned the power off and then back
on. As before, no transmit audio from either TNC.

Then, I issued a connect command at one end and that TNC's transmit
audio waveform started up. As soon as the other TNC saw the connect
request, then it's transmit audio waveform started up. The transmit audio
waveforms then stayed on (forever) as expected.

Obviously I found an interesting anomaly, but it certainly is not a
problem. I have found that the transmit audio generator usually stays
off until it is needed the first time, then it stays on as needed.
Certainly a good reason for a "fix" to not be found at the PacComm site,
because you don't fix something that isn't broken.

I really like the PacComm TNCs, and I am glad to learn that the
"problem" was that "I thought there was a problem, and there wasn't".

Thanks again!

I think I am right but I thought I'd better
check with those who might do this more often than I....

I have a rig (Yaesu FT-890) that doesn't specifically
do FSK. However it is rated so that I can run it
at 100% duty cycle at full power. It says in the
manual that FSK is possible by feeding the tones
into the microphone. I assume that this is legal
because technically there is no way to tell how
I am generating the FSK signals. Instead of,
let's say, 14.080 +- the shift I would be on
14.080 +- the audio frequencies into the microphone.
If I do such a thing should I be on USB or LSB?
I assume I should be USB so that the shift would
be in the correct direction.

Thanks

5409. RE: PACTOR II experience inquiry

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-10-14 00:00:00 UTC
From: interflex@msn.com
Message-ID: <00001fec+00001935@msn.com>
Source record: 34055

In reference to a question about whether to get the Pactor II tnc:

Pactor II units are indeed expensive. If you are a very fast typist, or plan to send lots of binary files on HF, you would want something fast.

However, for qsos that involve more than sending brag tapes or pictures, I know very few people who can type faster than ordinary Pactor can send data, and even fewer than can keep up with G-TOR. In fact, I've had RTTY qsos (45 baud) with some hams and one can sense the struggle they are having keeping up with the RTTY speed. Basically, the need for speed is a consideration.

The advantages of the original Pactor I, G-TOR, RTTY (Baudot), and AMTOR, is the use of standard FSK shifts, 170 or 200 Hz, and if your radio has FSK input (which is nowadays an input to a calibrated AFSK tone generator who's output is fed to the audio input to a SSB transmitter) you will find that Pactor II will not be able to use your radio's FSK features. Pactor II takes advantage of more than just Mark and Space tones, so is not compatible with a simpler two tone FSK type system. Pactor II tones must be injected into the transmitter as Audio.

The advantage of using the two-level FSK input (which is really just a contact closure, like CW, but the result is switching between Mark and Space tone rather than Transmit on Transmit off) is that the tone generator in the Radio is typically cleaner than tones generated by a TNC, and FSK inputs do not suffer from RF problems or other noise that gets into the audio circuits when modulating the radio with Audio from the TNC is used. On some radios, the filter selections and IF passband settings are automatically selected when FSK is used.

A system like Pactor II, and Clover, uses the Audio input (mic input typically) of the radio, and runs in Lower Sideband (typically). It is true that even FSK inputs on most modern radios is not really "true" fsk ("true" FSK changes the RF frequency by changing the resonant frequency of the RF section of the radio) -- most modern radios use digital VFOs, and take advantage of the fact that clean audio tone sent into a clean SSB transmitter will generate a single RF output with a suppressed carrier and no other sidebands. The idea of "clean tones" is why many amateurs use the FSK input to their transmitters, not because it is "true" FSK, but because the tones used to modulate the SSB transmitter are calibrated and clean.

You should look into the Kantronics All Mode (KAM) for example, as an alternative. It is about 1/3 the price, has dual port capabilities,

has good filtering (uses switched capacitance filters -- 6 of them)
and has a fairly large mailbox (100-K) and low power consumption and
a small overall size.

From: interflex@msn.com
Message-ID: <00001fec+00001936@msn.com>
Source record: 34056

Doug,

You asked about setting up the digipeater function:

First, which TNC do you have? If it's a Kantronics, you might want to seup a KaNODE instead, which works better than digipeating. This is a subject for another posting.

You can set a unique Digipeater callsign using the MYALIAS command -- which makes it different than your regular station (e.g. MYALIAS DIGI1). There are advantages to this. For example, since a remote user cannot actually CONNECT to a digipeater, if they try, it won't work.

If you allow your callsign to be used as the digipeater, a station may mistakenly connect to what they think is a digipeater, and be connected to your station instead, and start thinking about the digipeater as something that can actually be connected to. A bit confusing, true, but using MYALIAS will help by giving the dipeater function of your station it's own identification parameter.

Another advantage of MYALIAS is that if you decide you want to switch to a different frequency, you can ask another local station to "assume" your digipeating support (if they can offer the same general kind of connectivity) by asking that station to set their MYALIAS to what you were using. Then you can QSY, and another station can assume your digipeating support, and users will not have to learn a new digipeating path. Just a thought.

Have fun !!

Just a bit more, in case anyone is following this thread. I realized what got me looking at the transmit audio waveform in the first place.

If you turn on a SPIRIT-2, using PacComm's standard firmware, and as a first command type CAL, then hitting K toggles the transmitter on and off but with *NO* transmit audio. That's what distracted me, and when I learned that the audio can be started by glitching the power. Now, I find that I could have started up the transmit audio merely by hitting the space bar, to "toggle mark and space", something really not relevant to the G3RUH transmit waveform, but it certainly kicks off the transmit audio.

By the way, if the TNC is running X1J, and you connect via the RS-232 port, the CALIBRATE function in X1J does start the transmit audio. The anomaly seems to only be present with the PacComm firmware. And, hitting "space" once isn't a difficult workaround!

The G0BSX TNC runs at 38400 on the serial line with no problems. I
have also doubled the crystal frequency specifically for running at
9k6 on the radio because the TNC at the lower frequency was quite a
bottle-neck. If anyone needs the info on how to do this I'll mail it
to them. There's not much to it so it could also be posted to the
group if there were more than a few enquiries.

Paul:

I had the Same problem, but luckily I found the schematic page. From it I figured out:

Pin 1: Xmtr audio (audio out)
Pin 2: Ground
Pin 3: PTT
Pin 4: Rcvr audio (audio in)
Pin 5: ??? Didn't need to use it.

I would have replied by email, but I have a problem with my newsreader...

Good luck/73

5425. Network Node/Switch Suggestions

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-10-14 00:00:00 UTC
From: marty@trucom.com
Message-ID: <53scok$fau@thepit.trucom.com>
Source record: 34071

Hello, Folks:

Looking for suggestions for the node/switch hardware and software to use in a combination high speed and low speed LAN (some will say its really a WAN, but that's detail...). Any suggestions or comments are welcomed and needed!

First off, the nodes/switches MUST have two ports... One 1200 bps on 2m and one high speed port. The high speed ports will probably be on 33cm (not really decided yet) and we would like at least 56K bps, preferably faster.

It would be nice if the 1200 bps ports could be easily (read as "cheaply") upgraded to 2400 or 9600 at a later date.

Note that at least one node/switch will need a third port on 70cm at 9600 bps to interface with an existing network. For this one site, I see no problems using an off the shelf 9600 bps TNC on one of the COM ports.

A computer at the sites is not a problem, so long as a low end machine will do the trick... We have a bunch of 386DX-33 machines (VGA) that were donated to us! They have 4 megs RAM and 120 meg HDs and two COM ports each.

What we are looking at is the PI2 card with a GRAPES modem/transverter combination and running JNOS. We are thinking of adding the on-board 1200 bps modem to the PI2 cards so we would not need an external TNC.

As I understand it, the "new" GRAPES modem can't be modified for faster than 56K but the "old" ones can. Is this correct?

Finally, on the GRAPES modem/transverter combinations, is there anyplace on the Web with info on transverters? I have run across a few small things, but they don't amount to much.

Thanks for any info!

Take Care & 73

Yes, read this newsgroup for more than a few minutes and you'll see
references to NOS like Jnos, Tnos, and many more. Depending on the OS you
use you might even have drivers in the OS for this as well, and if not then
a nos program would be good.

Nice choices. Most network builders miss the fact that TNCs
inherently slow the network down when used with a computer -- the internal
cards are much better. Also, you might consider Linux as your router OS.

Barry McLarnon maintains a good list of hardware options for high-speed
packet, including transverters, at http://hydra.carleton.ca/articles/hispeed.html

>73, Jay
> w6go@netcom.com

The G3RUH design uses a data scrambler. This is a shift register
with feedback. It needs a data transition to kick it off. Sometimes
the power on glitch is sufficient, but usually it needs the first
flags bit to start it. Once started, it'll continue to run until
power off. This is normal behavior. The WA4DSY modem behaves the
same way.

>I assume I should be USB so that the shift would
>be in the correct direction.

Nope, AFSK generated FSK RTTY uses LSB by convention. The
tones will be right way up. They aren't +- the carrier
frequency, both are - from the carrier frequency, LSB
remember? If you use USB, they will be upside down.

And don't put too much faith in Yaesu's 100% duty
cycle claims. Throttle back to about 50% power.
Your finals will thank you, and your on-air contacts
won't notice the difference. Modern demods are *good*.

5433. Re: Help re simplex mode for high speed modem

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-10-15 00:00:00 UTC
From: Tom Holden <tholden@toronto.cbc.ca>
Message-ID: <3263EBE8.2139@toronto.cbc.ca>
Source record: 34079
Cross-posted to: comp.modems,rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Thanks to all who offered advice on my question.

In summary,

1. The designer of the Hayes Smartmodem 300/1200 modems and of the original AT command set confirmed that it was his intention to support a unidirectional test mode but is unaware that it was supported in subsequent Hayes modems or in thos eof other manufacture.

2. I have learned that high speed telephone modems go through an essential 'training' phase which, of necessity, requires a bi-directional path for negotiation.

3. Fax modems have been used for unidirectional data transfer at speeds of up to 9600 bps (V.29, V.27), in particular in Japan. A reference to the Japanese Packet Radio Users Group (PRUG) failed to turn up any further info.

4. Suggestions:
- use a short-haul 4-wire modem
- develop hardware/firmware specifically for application

Thanks to Rob Janssen, Jeff King, Gary Coffman, Dale Heatherington for the informative news posts and/or e-mails.

Regards,

Tom Holden, VE3MEO

Mark,

That depends. Do you want access to a commercial service? Amateur?

If the latter is the case, there are several BBSs that run packet, some running Pactor and some running Clover. As far as I know, none of them provide direct Internet access, but you may be able to talk one of the sysops into handling mail for you.

I am quite interested in this myself and would be willing to set something up if someone has some ready-made software for it. I have an Internet feed availalble 24 hrs/day, however, my HF antenna conditions are crummy - except when I am out cruising on the boat.

5443. LASER communication for HI-speed AMPRnet BackBone

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-10-16 00:00:00 UTC
From: Paolo Gaiardelli <pagaiard@freenet.hut.fi>
Message-ID: <32657D1A.D4B@freenet.hut.fi>
Source record: 34089

Today a laser FM tx and a phototransistor FM receiver costs about 200$
or less.

This equipment, using a laser diode has an enormous bandwidth.
I mean, 64kbps is a usual speed.

Why not use this system to xmit packets between two
mountains 200miles far ???

Such system does not require any legal license.

Yes, bad weather or rain may stop the laser beam,
but if you increase the power and expand the ream, the refraction
will not be a problem.

maybe this system has some possibilities.
It's bandwidth is too big to be ignored...

In addition this signal cannot be intercepted since it travel
high in the sky.

5444. Atl. OS/2 Java APRS Server Moved

Source record: 34090

I've moved my APRS server from http://wa4dsy-3.wa4dsy.radio.org/Xaprs
to: http://www.wa4dsy.radio.org/aprs/

Most of you were already accessing it through links at this URL
and won't be affected.

This is where is was originally before I put it on my debug machine
to work out the kinks. Now that it's debugged I've put it back
on the server where it belongs.

Those of you who were accessing the JavAPRS applet directly
or had web page links to any wa4dsy-3 addresses
will need to change your URL.

It isn't just speed that PACTOR II, or to a lesser extent Clover,
brings to the table. The more important feature is the ability
to work under much harsher conditions than ordinary RTTY, AMTOR,
GTOR, or PACTOR. That's because PACTOR II and Clover use more robust
modulations and more robust FEC than the others. PACTOR II will still
work with s SNR of -18 db. That's below the threshold of audibility,
and well beyond what the other methods can do. This allows you to run
less power, and use less elaborate antennas, than you would need for
the other modes.

PACTOR II and Clover also occupy less bandwidth, and can tolerate
closer first adjacent channel spacing than the other methods. This
means more users can operate in the same spectral segment. Coupled
with the lessened power requirement, this means these methods are
much more spectrally efficient. The quasi-duplex nature of Clover
shouldn't be underrated either. This can be exploited for data
networking purposes (similar to the old Telebit Trailblazers in
PEP mode).

>A system like Pactor II, and Clover, uses the Audio input (mic input
>typically) of the radio, and runs in Lower Sideband (typically). It

>of "clean tones" is why many amateurs use the FSK input to their
>transmitters, not because it is "true" FSK, but because the tones
>used to modulate the SSB transmitter are calibrated and clean.

But of course the tones generated for PACTOR II and Clover are even cleaner, generated with powerful DSP engines. And if you do have a radio that does real FSK, the P-38 can drive it for RTTY and PACTOR, though it still has to go in the mic input for Clover because that's a more complex waveform than simple FSK.

>You should look into the Kantronics All Mode (KAM) for example, as an
>alternative. It is about 1/3 the price, has dual port capabilities,
>has good filtering (uses switched capacitance filters -- 6 of them)
>and has a fairly large mailbox (100-K) and low power consumption and
>a small overall size.

Of course the SCF can't touch the DSP processing of either the PACTOR II box or the Clover card. Clover also benefits, with the P-38, from the tight coupling to the host computer. This allows things like on-screen tuning and channel statistics to be displayed in realtime. It also eliminates some of the clutter of boxes at the operating position. The P-38 is also a lot more cost competitive with the KAM. (It doesn't do packet, however.)

SCS's PACTOR II box is really triple ported. It can handle a PACTOR II channel and two packet channels (at better than T1 rates) with optional daughter cards. But it does face the serial port bottleneck, like the KAM, so some of that power can't be fully exploited. The tighter coupling of the P-38 retains an edge here.

The KAM is a nice multifunction box, but it can't touch the SCS box or the P-38 card for performance. And since the latter are DSP based, updates can be downloaded to them to change either protocol factors or modem performance. You have to change the ROMs in the KAM to update it, and that still won't change the basic modem function, because that's implemented in dumb hardware on the KAM.

I've had the opportunity to use all three units. I chose the P-38. If cost weren't a factor, I'd choose the SCS box in a heartbeat, but unfortunately cost is a factor. The KAM wasn't better, and wasn't that much cheaper than the P-38 so it was dropped from consideration. The KAM does packet, but I think HF packet is a bad joke, and for VHF+ I have the Gracilis card to drive 56 kb and 9600 baud modems so I didn't need that.

I also prefer the tight coupling to the PC bus that an internal card can offer. And due to the lower cost, there are more Clover stations on the air than PACTOR II stations, so having Clover capability was more important than having PACTOR II capability. If the PACTOR II box price drops, that could change. HAL has promised GTOR support in a future update, and while GTOR doesn't have any real advantages, it is in fairly wide use. I haven't heard a commitment from SCS to support GTOR.

However, I have a suggestion for the SCS folks. Add an ethernet interface. That would make the box worth more to me, and give

me nearly the same performance as a bus card. Add Clover and
GTOR support too, and you'll have an irresistable combination
if you can hold the price line.

>crystal in it, I think).

Modification of G0BSX TNC-2 to allow a 9.8304 Mhz clock speed.

0. Replace SIO and Z80 processor with 8 Mhz (at least) chips.
Z84C0008PEC (CPU) Z84C4008PEC (SIO) obtainable from Radio Spares

1. replace crystal with a 9.8304 Mhz one.

2. cut the track between pin 12 of IC8 (4040) and pin 29 of IC 4 (SIO)

3. A wire jumper has to be installed between the NEW 1200 Hz output of
IC8 pin 14 to pin 29 of IC4.

4. If the AM7910 is still to be used at 1200 baud, the connection of
pin24 on the AM7910 should be connected to pin 4 of IC7 (74HC393) to
get the 2.4576 clock signal. (remove the connection to pin 3 on IC7)

5. All the Baud rate jumper settings are now a notch higher, i.e. the
range is from 600 through to 76800 baud.

6. Consideration for the speed of the 27256 EPROM may be necessary,
-150 and -200 types have worked OK, -250 has not been tried (yet).

7. If you have problems such as the TNC will not initialize after
doing this mod check the FET VT1 in the reset circuitry to make sure
its fast enough or if you don't intend to ever use battery backup you
can wire to 2 outside legs (source and drain) of the FET together.

That should be all that's necessary.

If you feed the tones into the mic socket then it is AFSK not FSK which is where you actually switch the freq of an oscillator. Usually you cannot tell the difference on the air unless you are overdriving them it generates a lot of "splatter" and distorts your signal. I am not familiar with the FT890 but normally you would turn your drive up till you get full output so as not to overdrive the rig. If you feed the mark/space freq's of 2125/2295 then you should be OK.

With the just announced loss of another 5 MHz of Amateur allocated UHF spectrum in the U.S., its time to ask the hard question: Is Ham Radio Still Relevant?

We've posed that question and provided some answers - but not nearly enough. Times have changed. Ham Radio of the 21st century will not be like ham radio of the 20th century. Now is the time to engage in discussion on how to confront the challenges head on.

"Is Ham Radio Still Relevant?" is the subject of our newest editorial opinion at Ham Radio Online. At http://www.hamradio-online.com

Stop on by. Lots more cool stuff than *anywhere* else on the web. Now read in 47 countries around the world.

Source record: 34104

Hallo!

Just before while I've read an unofficial message saying that ISM band
at 433 MHz WILL BE REMOVED AND REPLACED by two exclusive segments at:
148.450 - 149.025 MHz and 153.150 - 153.750 MHz !!! This have been (?)
accepted in conference in Tel Aviv two weeks ago and it should be effe-
ctive in 1997! Maximum output power should be 500mW.

Does anybody know what's official statement and if this information is
true? Or is there any official source of these kind of information
(probably on the Web?).

Thanks in advance, your answers are greatly appreciated.

Most, if not all, of us who run CLOVER run open systems, and are
willing to support users on HF. Normal BBS operation gives access
to various internet email gateway systems. So for email, the
problem has a solution.

Actually a laser used for data communications would probably have a much faster transfer speed than that. If people can get 2Mbits/sec out of 10Ghz I am sure they can get more than 64Kbps out of a laser that ranges in the, what, THz?

Our school is working on such a project right now. When the experiment is done, the data will be sent from the top of a building on campus to a radio tower on the hill (we live in a big ditch), where it will then be shot to a nearby town. Approximate travel will be around 10miles one way.

Putting such a system on mountian tops, though, could possibly cause interference with air traffic. Haven't you ever heard that one is not suppose to shoot a laser at an airplane.

This is a very good idea though. I can't wait till we get our system to work. Hopefully before I graduate :)

TTYL,
Mike

>I assume I should be USB so that the shift would
>be in the correct direction.

Exactly speaking, both USB and LSB are possible depending
on the driving AFSK generator, but USB is the usual choice.
The common ham shift is 170 Hz using the IARU tones at
1275 and 1445 Hz. This for operation on the HF bands.
On VHF and UHF the 850 Hz shift is common with the tones
at 2125 and 1275 Hz. In contrast to nearly all commercial
stations, the shift is reversed at ham stations, i.e.
the start tone is at the lower frequency and the stop
tone is at the higher frequency.

Hello,

I have two pc's. I would like to have my packet-pc (PC nr. 1), which is
a 386 with tfpcx and the baycom-modem, running tsthost, to act to the
other PC (486) as a normal wa8ded-tnc. In this way, I can use two pc's,
with one radioport.

Is there a way to do this, perhaps by patching tfpcx?

Greetings,

Remco van Essen

I also have and use an 890 quite a bit for RTTY. It isn't the greatest rig for that mode but it's adequate. You can feed the audio into the mic jack or the data in/out jack on the back. The data jack is basically paralleled off the mic. I feed mine there but have found I need to unplug it is running SSB because I get muddy audio. Don't know if this is cause of a mismatch or RF coming in the data jack.

The normal convention on RTTY is LSB. You will need to invert to recieve on USB. You are right about the carrier shift but it is not real critical. I suppose a purist would stay ~700Khz above .080 but I have only seen it an issue on MARS where there are specific freqs used.

AMATEUR RADIO SPECTRUM DEFENSE BULLETIN
Friday, October 18, 1996.

ACTION NEEDED BEFORE ELECTION DAY!

PLEASE DISTRIBUTE THIS INFORMATION TO YOUR LOCAL HAM RADIO CLUB and to any U.S. hams you communicate with.

If we do not act now, our 2305-2310 MHz frequency band will be sold at auction! Other Amateur bands may not be far behind. Please FAX or mail the following letter (or write your own letter) to your congress and senatorial candidates and incumbents before the election!

Here is a template for a letter, or you can write your own. Of course, please read the entire template carefully replace the information surrounded by "***" with the correct information for your letter. If you can, please tell us who you've contacted or send an entire copy of your letter. Use the e-mail address letter-copy@hams.com .

You can find the addresses and telephone numbers of your congressperson and senators using a World Wide Web browser. Use the web page http://www.voxpop.org/zipper/ . Pass your legislator's addresses and phone numbers on to the hams in your district, along with the template.

********** Cut here - Start of Letter **********

CONGRESSPERSON_OR_SENATORS_NAME ***YOUR_NAME***
ADDRESS ***YOUR ADDRESS***

Dear ***CONGRESSPERSON_OR_SENATORS_NAME***, ***DATE***

I am a Ham Radio Operator. There are over 600,000 licensed Radio Amateurs in the United States, and many of us are voters in your own district. You've probably heard of the role of Radio Amateurs as public-safety volunteers: we regularly provide emergency communications to local emergency services, the Red Cross, and to Federal disaster programs when natural disasters have devastated power lines and telephone networks. Amateur Radio also is also important to education: many of today's high-tech pioneers first learned electronics by becoming Amateur Radio Operators, and many inventions in communications and computer technology continue to be made by Radio Amateurs.

In the last hours of the past Congressional session, language was added to the Omnibus Budget Bill to sell one of the ham radio frequency bands! The 2305-2310 megahertz band will be taken away from Radio Amateurs, and will be sold to the highest bidder. I've included the

text of that part of the bill at the end of this letter. The bill was passed by Congress and signed by the President.

Reallocation of frequency bands is usually the jurisdiction of the FCC. We were deprived of any chance to be represented because the FCC's public comment procedure was bypassed, and because the text of the bill was not released to the public before it became law. Because the Omnibus Budget Bill was 2000 pages long and this text was added to it at the last minute, you may very well have voted for the bill without ever reading the portion that reallocated our frequency band.

Amateur Radio is currently in deep trouble holding on to its frequencies. In the past several years, we've lost several frequency bands and have been forced to share others with unlicensed transmitters that have effectively forced us off the air. Currently, almost every Amateur Radio frequency band is under attack by companies that would like to acquire our frequencies and charge others for using them. We've already lost as much as we can tolerate.

Please write back to me. Tell me if you voted to pass the Omnibus Budget Bill, and if you were aware of the provision to sell the 2305-2310 megahertz frequency band when you voted. Please tell me if you are willing to help us retain this frequency band and protect our other frequencies when the Congressional session begins in January. You can start helping right now by contacting the Washington counsel of the American Radio Relay League, Mr. Chris Imlay, at 202-296-9107 or 202-296-9100.

Many Thanks

YOUR_NAME
Radio Amateur ***YOUR_CALLSIGN***

Here is the text of the the portion of the Omnibus Budget Bill, public law 104-208, that directs FCC to sell our frequencies.

TITLE III -- SPECTRUM PROVISIONS

SEC 3001. COMPETITIVE BIDDING FOR SPECTRUM

(a) COMMISSION OBLIGATION TO MAKE ADDITIONAL SPECTRUM AVAILABLE -
The Federal Communications Commission shall --
(1) reallocate the use of frequencies at 2305-2320 megahertz and 2345-2360 megahertz to wireless services that are consistent with international agreement concerning spectrum allocations; and
(2) assign the use of such frequencies by competitive bidding pursuant to section 309(j) of the Communications Act of 1934 (47 U.S.C. 309(j)).

(b) ADDITIONAL REQUIREMENTS -- In making the bands of frequencies described in subsection (a) available for competitive bidding, the Commission shall --
(1) seek to promote the most efficient use of the spectrum; and

(2) take into account the needs of public safety radio services.

********** Cut here - END OF LETTER **********

Message-ID: <326838E9.3E8C@tomcat.gsfc.nasa.gov>
Source record: 34116

The other thing you need to do: Many original TNC2s used LM324 OP AMPS
as RS232 line drivers. These parts are too slow for higher speeds
(even marginal at 9600) and you should swap in a higher speed part.

Tom, W3IWI

5471. Bulletin Export Files Available

Newsgroup: rec.radio.amateur.digital.misc

Hello, Folks:

I now have Packet Bulletin Export Files available on my Home Page.

The files are split by distribution group. I now have the following available: ALLUSA, WW, EU, CANADA, ARRL, AMSAT, and NASA, and many others. Others may be added as needed.

Files will be posted daily and should be online after about Noon Central Time.

Just point your Netscape 3.0 or MS Inetrnet Explorer 3.0 browser at:

http://www.trucom.com/ppages/marty

and go to the Amateur Radio area. The rest should be clear to all.

NOTE: New export files by distribution are being added almost daily! Many thanks to all who are sending me their BBS exprts via attached E-Mail for inclusion!

I have just today (17 OCT) updated the pages to include a Frames Version that makes navigation around the site easier. Note that the non-Frames Versions are still there but the URLs have changed.

Take Care & 73

Hello, Folks:

I have just put up my new home page and invite all to drop in for a look. Included at the site are the following areas:

Ham Radio -- Mostly packet, mostly high speed

Pipe Smokers -- Very, very much still under construction

Astronomy -- Mostly Amateur Radio Astronomy (good 2nd interest for Hams!)

Mapping -- Mostly about elevation maps - NEW INFO!

The URL to use is:

http://www.trucom.com/ppages/marty

I have just today (17 OCT) updated the pages to include a Frames Version that makes navigation around the site easier. Note that the non-Frames Versions are still there but the URLs have changed.

Thanks!

Hi !
I am very interested in connecting my PC to the internet by radio.
As far as I understood I have to obtain a HAM licence and to buy some
essential equipment like TNC, Packet modem & Transceiver. The problem
is that I do not know what to buy. When I opened several catalogs
(Universal radio, ham-outlet) I found there many products. And I
realaized, that I _DO_NOT_ know what DO I need. For instance, there
were twelve TNC, and I did not know which is sutable for my need. The
same story with Transceivers. So, please if you can help me.
My other problem it, that I want to have 57.6 Kbps. But I read that
many HAMS support only 1200BPS Why? Can't I establish for myself 57.6
Kbps connection ?!
Thank you very much, for reading this message.
Igal
P.S If you can, please tell me how Much TNC & Transceiver would cost.

You're too pessimistic, Rob. I agree that 200 miles is probably
way out of line, but 2 km is certainly practical in many circumstances.

>
>Why not use this system to xmit packets between two
>mountains 200miles far ???

They would have to be rather tall mountains. You need true line of
sight, and the horizon curves away rather sharply. A good approximation
of the distance in miles for maximum line of sight *over smooth Earth* is

D = sqrt(2*Ht) + sqrt(2*Hr)

Where D is distance in miles, Ht is transmission height in feet,
and Hr is reception height in feet. If we assume D is 200 miles,
and set Ht=Hr, then the minimum required mountain height is 5,000 feet.
That doesn't sound like much, but this equation assumes a smooth
Earth, IE that the only projections are the two mountains in question.
That's rarely the case in real terrain. We have to figure the
HAAT for the two points so that they are 5,000 feet above any
terrain between them. That constrains us quite a bit.

>Such system does not require any legal license.

Well, it doesn't as long as you keep the power down.
In the US at least, if you start cranking up the power
you come under a number of regulations.

>Yes, bad weather or rain may stop the laser beam,
>but if you increase the power and expand the ream, the refraction
>will not be a problem.

There are limits to how far we can expand the beam and still
have reliable communications. Those limits can be quite
constraining even for relatively short paths. Fog is more
dispersive than rain, but both can be troubling. Refraction
due to thermal cells in the path can also divert the beam
or cause it to bloom. Adaptive optics can help enormously,
but still, a 200 mile path in the lower atmosphere is tough.

>maybe this system has some possibilities.
>It's bandwidth is too big to be ignored...

The possible bandwidth is much bigger than you've stated.
But the practical range is probably much less than you
have stated except in unusual terrain.

>In addition this signal cannot be intercepted since it travel
>high in the sky.

Well, yes it can be intercepted. The lower atmosphere is dispersive
even when clear thanks to dust particles. The beam can be "tapped"
with a sufficiently sensitive detector located off the path.

The problems of open air laser communications are sufficient that
they are probably best limited to short line of sight use, IE less
than 10 miles. In space, where there is no dispersive atmosphere or
horizon limits, or when guided in fibers, laser communications is a
near ideal way of handling high bandwidth over long distances.

Laser communications is a good area for amateur experimentation.
The cost of entry is low, regulations few, and potential bandwidth
is large. But we need to keep some realities about the lower atmosphere
in mind. We can sometimes "Dx" long distances if location and conditions
are just right, but to design a three nines path is a different matter
altogether.

>
>Rob
Well, your mileage may differ. I've used the 741A with packet using the
PK-232 with no problems whatever. The 741A is not ideal for packet since
it lacks a separate digital connector on the back. This means that you have
to go in via the mic jack. With the 741, this means you will probably want
to get Kenwood's mic adaptor cable, which adapts the nonstandard mic
connector on the 741A to the standard variety. This is easily done, although
it costs a few bux.

Good luck.

Just a follow-up...

The wiring diagram I used so far is as follows...

From the DIN connector supplied with the unit...

White to TIP of 3.5" connector via 0.22 mf capacitor.
Red to TIP of 3.5" connector vis 2200 ohm resistor.
Shield to SLEEVE of 3.5" connector

Green to TIP of 2.5" connector.
Brown to SLEEVE of 2.5" connector.

No real idea as to where the Black wire (DIN pin 5) goes. Nothing at all in the
diagram for my particular radio.

OK, so I've just picked up one of these AEA packet modems, and I'm having a devil of a time getting it to go with my Yaesu 727R handheld. I've wired the thing up _exactly_ as per the diagram in the manual for the thing for my particular radio, and no dice. I just can't seem to get the thing to transmit (or receive, for that matter).

Has anybody got any suggestions/tips/tricks I ought to know about configuring this packet modem with this or a similar unit? In case it's necessary, I'm hooked up to an 8088 using QuickLink II as my terminal program, and it seems to be communicating with the PK-12 just fine.

I'll look in this newsgroup, but just to be sure, I'd appreciate e-mail.

> pass that around and say it again....

It might be used as an argument to get more spectrum space elsewhere,
but it is not likely to happen on the 7,100 - 7,300 portion.
The 41 meter BC band needs to be several hundred kHz wide, and
doing what you suggest means not only displacing the BC transmitters,
and redoing the frequency coordination, etc all over, but also
entains shifting the band UP by 200 khz, and the folks up there
might not be amenable.

Possibilities now include: making the 40 meter band 6,900 to 7,100
worldwide, or adding to the narrow 10.1-10.15 mHz 30 meter band,
or restoring 20 meters to its former 14,000-14,400 kHz.

The possibilities for losses are: upper end of 75 meters to
tropical broadcasting (75 and 80 are already much smaller than
3500-4000 like here in the USA). Losing part of 160 meters to
AM BC if and when it expands to the 1700 to 1800 spectrum (radio
location will move up from 1.7-1.8, it already was displaced
from 1.6-1.8 segment, and high power ham is not compatible with
nearby broadcasting either....). And you all know about the
144 and 420 bands; look at Canada and Mexico for what has happened
to the 420 band, specially Mexico. In a short time you are going
to see tremendous pressure put in the 50 mHz thru 1300 mHz bands
as that is the most useful portion of the vhf/uhf short-range
spectrum for commercial, military and public service communications,
never mind satellites, wind profiler radars, TV and FM broadcasting,
etc.

A bright spot might be the elimination of the VOR air navigation
system in the 108-118 range, but there are problems. 117-118 is
voice not navigation in various parts of the world, and the ILS
instrument landing system has alternate channels in the 108-118
segment. My bet is that the frequencies will find another

aviation use as the comm part from 118-137 is pretty crowded.

Also, the air force/military pretty well has 225-400 with but very few civilian signals there like the glideslope part of the ILS or part of TACAN which is available to civilians. Mostly, this spectrum is a wasteland, with an ocassional radar or military voice comm.

Good luck, I don't think any areas of v.h.f. are going to be vacated by anyone, and certainly not to hams. On H.F., anything can happen.

5485. Worldwide, Broadcast Free, HF bands

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-10-20 00:00:00 UTC
From: Allen Dayton <adayton@erols.com>
Message-ID: <326A1BCB.5B01@erols.com>
Source record: 34131

There is some hope for freeing up some of the hf bands. A company called Worldspace (on the web) is putting up three satellites for audio broadcasting the same type of programming that shortwave broadcasting is currently doing. I think that this will be so much better than HF, that many of the current sw broadcasters will move to it. It should also be a lot cheaper for them as big hf stations are expensive to run.

Also, satellites such as those provided by Inmarsat and the follow-on types such as ICO have almost replaced marine hf radio and by the year 2000, I see almost no market for Marine hf radio as there will be four or five "mobile satellite systems" with worldwide pricing below a dollar per minute.

We should be working to lobby the fcc and to get our WRC representives to go after these frequencies for worldwide hf bands.

: Why not use this system to xmit packets between two
: mountains 200miles far ???

Probably not 200 miles. You can go out and by high power laser communications equipment and they're usually rated at about 1 or 2 miles maximum. Also 64 kbps would be a real real slow data rate now, when businesses buy them they usually pick up the 10 MBs versions that have ethernet interfaces on them (I know someone who has a pair laying around too, he says they're fun to play with networking computers together).

Most people don't use laser links though because they just aren't good enough. They are a pain to align at even short distances where you can see the person at the next building with binoculars, rain likes to scatter lasers, and good luck with snow. Around the Detroit area businesses that have tried them usually switched over to WaveLAN cards and directional antennas. At least with WaveLAN cards businesses and colleges are getting about 5 to 7 miles on point-to-point links and can cover their building or campus on omni antennas.

: Such system does not require any legal license.

Either do WaveLAN cards.

: Yes, bad weather or rain may stop the laser beam,
: but if you increase the power and expand the ream, the refraction
: will not be a problem.

In response to Ed's question...

YES it is! But we do need to make it clear to Washington D.C. if we
hope not to lose any more frequencies. It appears that the loss for
frequencies is increasing at an alarming rate lately.

Don't forget the VHF TV spectrum. All 72 MHz of that are going to be up for grabs when TV changes over to HDTV. (HDTV will be a UHF only digital service.) I don't see hams getting any of that, but it may relieve some pressure on amateur allocations at VHF (if we can hang on until then). Those frequencies are already used for other purposes outside the US, however, so the release of those frequencies to other uses in the US doesn't relieve pressure on amateur bands for worldwide uses, IE the little LEOs need a worldwide allocation.

On HF, it appears that SW broadcast isn't going to move to SSB as was planned. The tuning demands on consumers appear to be to much to make that viable. Compatible digital is on the horizon for SW broadcasters, though, just as it is for MW AM broadcasters. That could have several significant impacts.

1) The power level needed for compatible digital is much less than for standard AM (about 20 db less). This means entry cost into SW broadcasting can be significantly reduced. But tolerance of interference from other services may be lessened.

2) No guardband is needed for compatible digital. This means there may be no "cracks" for amateurs to play in. The compatible digital signals can overlap slightly without harm, but other types of signals may not be so easily tolerated.

3a) Compatible digital lends itself well to ALE techniques. This means broadcasters may want to do more frequency hopping to follow the MUF to their target audiences.

3b) The consumer receivers can be designed to automatically find and track the desired broadcast service. This removes even the burden of knowing where to tune from the consumer. He just punches in the name of the broadcast service he wants, and the radio does the rest. The receiver manufacturers say this can be embedded in a single consumer chip.

3c) This also means that SW broadcasters don't have to maintain schedules fixed months in advance. They can pop up anywhere anytime that the MUF permits coverage to their target area. (I wouldn't be surprised to see a dynamic near realtime scheduling system deployed by SW broadcasters worldwide, perhaps utilizing the internet, to coordinate rapid changes of frequency without collisions with other broadcasters similarly chasing the MUF.) The consumer won't care or notice, his receiver will automatically follow.

4) Compatible digital also brings stereo and strong resistance to wideband interference (such as impulse noise), gaussian noise, and multipath fading. This means SW broadcast will be on a more even footing with competitors such as satellite DAB. (And incidentally may make Standard Broadcast once again competitive with FM broadcast.)

The potential impact on amateur HF operations should be clear. We're likely to see more SW broadcasters in the future thanks to lower entry costs and better performance. And we're likely to see demands for more frequencies, and for frequencies clear of relatively high power narrowband signals which might impair compatible digital reception.

(Note, there are other forms of digital transmission which would be more, not less, resistant to interference from narrowband signals, but the compatible digital technique wasn't developed for that purpose, and doesn't meet that objective. It can be used on the same channel with the *same* broadcaster's AM signal, thus the compatible name, but that other signal has to be phase locked with the digital signal, implying a common transmission point.)

If Standard Broadcast adopts this technique, and there's good reason to believe it will, then SW broadcasters almost certainly will as well. This has the potential to practically eliminate narrowband amateur operations at HF as pressure mounts for clear, harmonically related, frequency bands in which to operate compatible digital broadcast.

Other services are also taking a second look at HF. But most of them would employ FHSS systems which wouldn't be bothered by amateur transmissions, or cause any bother to amateur or compatible digital SW broadcast, and likely aren't too much of a threat to amateur allocations. The SW broadcasters, however, could be a very serious threat if they adopt this new techinique. It may well be that the only way amateurs might be allowed to maintain a foothold at HF would be if they adopt FHSS techniques themselves.

I tend to think that such revolutionary change in HF usage will be a fairly long time coming, but when we look at other consumer technologies, such as the compact disc, these changes have a way of gathering a momentum of their own and very rapidly

taking over. The speed of the demise of the LP in favor of
the CD shocked nearly everyone. The phenomenonal growth of DSS,
and the pending switch to HDTV here in the US, are indicators
that a change to SW broadcast could also be swift, massive, and
nearly unforeseen by the general public.

You obviously haven't looked at the Dx records for the 2.3 GHz band.
And who says Dx is the important metric anyway? Most users of 40m
today aren't Dxers. We're talking about 5 MHz of bandwidth here,
more than all the amateur HF allocations combined.

Sounds like something is corrupted. Try powering down, removing the
battery jumper (JMP5, I think), leaving it off for several minutes to
discharge the RAM contents, re-installing and powering up again.

Hello!

I just learned a little about Packet Radio the other day, and it sounds
interesting. A couple questions:

* How fast does it run (bps)?
* What do I need (equipment wise)?
* How much does it all cost?
* What are some catalogs/resources I can use?
* What kind of liscensure do you need?

Thank you!

rec.radio.amateur.digital.misc:

>I just learned a little about Packet Radio the other day, and it sounds
>interesting. A couple questions:
>
>* How fast does it run (bps)?

I believe FM packet (2 meters and up) is 9600 max and HF is down
around 2400.

>* What do I need (equipment wise)?

A computer (you already have that), a radio, and a TNC.

>* How much does it all cost?

TNCs run anywhere from under $100 to over a few hundred dollars. The
Kantronics KPC-3 last I heard was around $90.00. The AEA PK-88 last I
heard was around $150.00.

>* What are some catalogs/resources I can use?

Call 1-800-555-1212 and ask for the number for Ham Radio Outlet.
They'll send you a catalog with everything you'll need.

>* What kind of liscensure do you need?

I take it by this question that you do not have an Amateur Radio
license at all. You'll need at least a Technician Class license to
work 2 meters (144-148 MHz) packet which is the most popular band.
The license entails knowing a basic understanding of electronics (what
resistors, capacitors, and diodes are), basic understanding of the
Rules and Regulations (most are common sense), and what frequencies
are allocated to the Technician Class license. Go to your local Radio
Shack and get a book called "Now You're Talking". It's really great
for the Technician and Novice Class licenses. It'll have everything
you need to get your license.

Hoep This helps,

Greetings all,

I've been kicking around the notion of controlling my old Kenwood Ts-440 HF rig with my PC. I've found plenty of shareware programs that handle the PC end of things, but I'm a little shy about forking over 100+ bucks to get the official Kenwood interface box (especially since we have a new baby at home now). Are there kits and/or schematics for boards out there which could replace the Kenwood box? I assume it's just a TTL to RS-232 interface, but I'm not sure. Also, what about the EPROMs which plug into the radio? Are those only available on the used market these days? I'd be happy to hear from anyone who uses PC control for a '440 (homebrewed or otherwise). Thanks a lot.

The external box for the '440 is nothing more than a level translator.
converts TTL on the radio side to RS-232 on the computer side. You
can use the Maxim MAX232 series ICs to do that.

I'm not aware of any EPROMS that need to installed in the radio.
In my 440, the only ICs that needed to be installed were an 8255
UART and a 4040 ripple counter if memory serves.

Good Luck

Steve Muther WF6R

Try from a bowl shaped valley in Puerto Rico. To my knowledge, the
longest radio path used for two way communications by amateurs on
2.3 GHz has been 500,000 miles. Of course the simple little 22,500
mile hop we call mode S has been done by many people, even me.
Try pissing that far hotshot.

5506. Help with Intel 82510

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-10-21 00:00:00 UTC
From: bailey@osb1.wff.nasa.gov
Message-ID: <54g2ad$1ns@post.gsfc.nasa.gov>
Source record: 34145

I am trying to initialize an 82510 in an embedded design and am having great problems. I am simply trying to put the 82510 in the 8250 compatability mode and set the baud rate to 1200 baud. I have read all the appropriate data books and this seems like a simple proposition. Sometimes the chip initializes correctly and sometimes it does not. Does anyone have any ideas? Here is my 'C' code:

```
/*-----------------------------------------------------------*/

GIRBANK = 0x00; /* Switch to bank 0...8250 mode */
LCR = 0x80; /* Setup for baud selection */
BAL = 0xa0; /* Set 1200 baud...with 16 Mhz crystal */
BAH = 0x01;
LCR = 0x03; /* 8 data bits, no parity */

while(1) {
/* Wait til TX buffer empty */
while( ((value = LSR) & 0x40) == 0);

TXD = 0x41; /* Write the character 'A' to port */
}

/*-----------------------------------------------------------*/
```

Thanks,

Steve

Look into paKet from Germany, I think. It works wonders for packet!
It has it's own BBS built in that can handle forwarding of mail and
bullitens. I wouldn't use it for a large BBS, but it can work real
nice for a few local people to chat and so forth. If there's a local
BBS to you they can forward ARRL bullitens to you to have others
retreive them off your system. I don't know if it's on the Web, but
you can look for it in the major archives.

Hope This Helps,

Hi Fred!

There's a config file for the pk-900 in tpk182.zip that works for the
dsp 2232. The help file has references to using the pk-900 that also apply.

I had two config files, one for 1k2 and hf, and the other for 9k6, and
swithced from one setting to another as needed.

Since then I changed to WinPack 5.53, that does everything tpk does but is
much easier to set up and run.

This is absolutely no problem and you even don't have to patch anything.
Just use PC/Flexnet (see
http://www.th-darmstadt.de/diverses/afthd/flexnet/)

To connect your 486 to the 386 you can use KISS over RS232, the
parallel port or even 2 ethernet cards. There is a TF compatible
software emulator available (tfemu), so you can use your
favourite hostmode software.

From: dj1@prairie.lakes.com
Message-ID: <54hjrt$lk4@News2.Lakes.com>
Source record: 34010

Hello all,

I have been trying to get BPQ and NOS to talk nicely to each other. I am having limited success however I have a few questions. I am using the attach BPQ in JNOS, however when I do a "bpq" it shows that the JNOS link is always disconnected. I can connect out and have limited success connecting back in. I have played with setting up a second port in BPQ as type internal, but that doesn't seem right to me. All my other applications show their stream connected (DX cluster, FBB when running on top of BPQ except for JNOS.

BPQ is configured for no node support, only BBS support which should go to NOS, however when you connect into the call, it replies that the BBS is BUSY.

I think I am on the right track, however the docs are unclear. I have NOS2BPQ and others that just show the NOS side of things. I think that I am missing parts for BPQ, items such as AAPLMASk, or maybe I have to define another "COM" port in BPQ. Any help you might give would be appreciated!

From: bsager@interserf.NET
Message-ID: <199610221119.HAA11568@ns.interserf.net>
Source record: 34011

Hello,

I am working with a group on a developing a vhf/uhf digital bandplan
for our area and we have had varying opinions on the following subjects.

1. Will 1200 baud and 9600 baud packet work together on the same
frequency?? We've heard they will and do it well, while others say that one
will just "walk" on the other. What are your experiences or can you
recommend a site where I can find some information on this??

2. Can AX25 and TCP/IP programs work together on the same frequency??
Some folks are saying that with parameters set right that they cohabitate
well together while others strongly disagree. Also will it make any
difference if the programs are running at different baud rates??

I've looked around the TAPR site without success on the above subjects
but maybe I am just looking in the wrong place.

Any thoughts or suggestions on these subjects would be appreciated, we've
run into a lot of basically "hear-say" but no documented facts or true
reports.

Thanks much for taking your time to answer questions that have
probably been answered many times! But unfortunately I can't find those
answers... :-)

As if spectrum itself were capable of it's own decisions.
I'll avoid asking any female hams to comment on this
brilliant bit of logic. ;-)

Perhaps you are not up to the fight (mentally) for
what is needed to truly utilize the bands and modes
of operation that will keep amateur radio alive in
the 21st century.

HF is a good piece of the spectrum to have access to.
But it's just one piece. IMO we are losing much of
the spectrum above 70cm because we have not effectively
utilized it. Only through increased experimentation,
knowledge and acceptance of newer modulation methods
will we prevent further loss on UHF and up.

>recommend a site where I can find some information on this??

No, these two speeds do not work well together on the same channel. The DCD of one won't be activated by the presence of the other on the channel, thus they will collide frequently. The 1200 baud Bell 202 modem won't detect the 9600 baud G3RUH modulation as a valid data carrier and vice versa. You *can* use RF DCD, derived from radio squelch, to tell the TNC to hold off, but this is clumsy, requires modification to the radio, and sometimes to the TNC, and is undesirable for other performance reasons. And it only takes one amateur out there not using RF DCD to screw things up. Put these speeds on different channels.

Even if you could get everyone to modify their radios and TNCs so that they would respect the presence of the other signal modulation on the channel, mixing speeds on the same channel is still a bad idea. It reduces throughput something awful because the two speeds need different timing parameters, but when you mix them you have to use the slower method's timing values in all the TNCs. That makes having 9600 baud hardly worth the effort.

>2. Can AX25 and TCP/IP programs work together on the same frequency??
>Some folks are saying that with parameters set right that they cohabitate
>well together while others strongly disagree. Also will it make any
>difference if the programs are running at different baud rates??

TCP/IP datagrams are tucked *inside* an AX25 wrapper, IE IP and TCP are layer 3 and 4 protocols respectively and still require the AX25 layer 2 protocol over radio. Thus everything on channel is still AX25 at the link level and works properly. The only "problem" you may have is that TCP/IP stations tend to be rather active and generate a lot of data, IE in addition to telnetting (keyboard chatting and remote log in), they may be popping mail via smtp from a POP server, ftping binary files, doing netnews via nntp from a news server, etc.

It is better to try to convince TCP/IP users to use higher speed channels because those channels will have more capacity to handle the larger expected

data volume TCP/IP stations often generate (this won't be hard, most TCP/IP users aren't naive and want all the performance they can get), but they *will* share a channel properly with stations using just the raw AX25 link level protocol if necessary because their packets are also AX25 at the link level.

TCP/IP operators seldom limit their activities to keyboard chatting, so they can make the channel rather busy. They will frequently transfer binary files, and this can drive naive users who have simple terminals, and leave monitor turned on in their TNCs, crazy, IE the equivalent of the ASCII bell character as well as other nominally non-printing characters appearing in the binary data can confuse a simple terminal if it is monitoring all data on the channel. This is really the monitoring station's problem, and is easily solved by turning monitor off, or using the filter command in their TNC to filter out non-printing characters, but you may get some complaints from those who don't understand what's happening. This is really an education issue and not a technical sharing issue.

>>* How fast does it run (bps)?
>
>I believe FM packet (2 meters and up) is 9600 max and HF is down
>around 2400.

HF packet is 300 baud, except on 10m where 1200 baud is permitted.
On 6m and 2m, 1200 baud is usually the minimum speed, and speeds up
to 19.2 kb are permitted. Between 219 MHz and 450 MHz, 56 kb is the
fastest speed permitted. Above 450 MHz, any speed that fits inside
the band edges is allowed. (These are US Part 97 limits, there may
be differences in other countries.)

Note well that these limits are on baud and not bits per second.
Symbol overloading can be used to send more than one bit per baud
(similar to common telco practice). This isn't commonly done for
packet, but it is permitted. Most packet operation is half duplex,
so the baud listed above aren't directly comparable to duplex telco
practice. However, duplex operation is permissible on packet, you
just need twice as many radios.

>>* What do I need (equipment wise)?
>
>A computer (you already have that), a radio, and a TNC.

That'll do it, but the TNC is a somewhat obsolete paradigm.
For 1200 baud operation, a simple single chip 202 modem and
some software on the computer can handle packet without a
separate TNC. This is the Baycom approach. For faster speeds,
the RS232 link between TNC and computer becomes a bottleneck.
The better approach here is to use a synchronous interface
card plugged into the computer bus which supports DMA. This
is attached to the high speed modem via a synchronous RS422
link, or by direct TTL. Software running on the computer again
handles the packet protocol. The TNC idea was developed in the
era of dumb terminals, and doesn't fit well with the modern
practice of using a host computer.

The radio can be an issue at higher speeds. What you need is
a data radio or RF modem, not a FM voice radio, when speeds

climb above 4800 baud. TEKK, AEA, Kantronics, and MFJ make
suitable data radios for 9600 baud and 19.2 kb. For 56 kb,
you want to use an RF modem such as the WA4DSY modem. It
is both modem and radio, though you need a transverter to
kick it to a UHF band. Above 56 kb, you need even more
specialized equipment (though it can be cheap in some cases,
IE the ethernet card and gunnplexer approach) that you'll
probably have to build yourself.

Note also that while a FM HT *can* be pressed into 1200 baud
service, it is a poor choice. You'll usually want to use a
real radio running 10-50 watts into a good outside antenna.
This keeps you from becoming a "hidden terminal" on the network.

>>* How much does it all cost?
>
>TNCs run anywhere from under $100 to over a few hundred dollars. The
>Kantronics KPC-3 last I heard was around $90.00. The AEA PK-88 last I
>heard was around $150.00.

The TCM3105 modem chip is about $5. An Ottawa PI2 card is about
$125. A G3RUH 9600 modem is about $90, and a GRAPES 56 kb RF modem
is about $350. That spans the range from slow to fast. As noted
above, you probably don't want a TNC unless you're using a dumb
terminal.

A final thought, it does you no good to have the fanciest and
fastest equipment in the world if no one else has compatible
equipment in your area. For any speed above 1200 baud, consult
with local amateurs before spending any money.

Gary

Kevin (et al),

In terms of today's technology, we're not effectively using ANY of our spectrum allocations ... NONE, ZIP, NADA ...

The majority of today's hams are so far behind the power curve of technology that they'd have to study 3 nights a week for six months just to try to catch up ...

Of course, in times past, when hams were leading contributors to technology (rather than the resistors that they've become) that's exactly what hams DID ... they spent their leisure time studying, building things, experimenting, operating, and improving themselves ...

Today, most simply want to turn on the radio and yack once in a while, or participate in the contest on the weekend, or collect a few more 10-10 numbers (who ever thought of THAT stupid activity???) ... it reminds me a lot of the old ethnic joke where a guy hands someone a small business-card-like card, which says:

"What does it take to keep a <fill in the ethnic group here>
busy all day? (see other side)"

and, of course, on the other side of the card it says:

"What does it take to keep a <fill in the ethnic group here>
busy all day? (see other side)"

The vast majority of ham radio has, in fact, become nothing more than "CB with an attitude" ... and a BAD attitude at that ...

We need to make drastic, fundamental changes in the way ham radio is looked at, both from without AND from within ...

Source record: 34017

VERY IMPOTANT MESSAGE

To all European users of "Black Belt System AVT 5.40"

I am experiencing some technical problems with this program. My Amiga 4000 tower PAL (50 hz) Does Not run AVT 5.40 which has been created for 60hz Amigas.

After several and un replyied e-mails to the technical support of Black Belt. I finally decided to contact them by phone. The answer the techncian gave me was

"You have to change the 50hz crystal by a 60hz crystal", but he doesn't know where I can find one.

Now the question is, is Black Belt System a really SERIOUS company, which doesn't reply to your mail and explanied U that to run THEIR programs you have to change your hardwae at your own risks..... ???

If someone has information about AVT 5.40, or is in the same case as me, please mail me at

aargand@uniplus.ch

Thanks in advance

--

First of all, I would like to apologize for my English which is not very good.
But I will not have any problem to understand your answer.

Cheers, Alain.

The ARRL leadership mentioned at Pacificon this weekend that one of the issues before WRC is "realignment of 40 meters". It seems that many nations do not grant Amateurs privileges on the portion of 40 meters where the broadcasters are. Now, they didn't say what this realignment was - does it mean we will get different, broadcaster-free, spectrum, or does it mean that we will have the broadcast portion deleted from our privileges as it is for Amateurs in other parts of the world?

Source record: 34020

In message <54hjrt$lk4@News2.Lakes.com> Sean R Stepanek wrote:

> I have been trying to get BPQ and NOS to talk nicely to each other.

Here's the port entry for the JNOS in our BPQCFG.TXT

```
PORT
ID=Link to GB7BBC-5
TYPE=INTERNAL
PROTOCOL=KISS
QUALITY=255
MAXFRAME=7
FRACK=7000
RESPTIME=2000
RETRIES=5
PACLEN=236
ENDPORT
```

And some bits from our "autoexec" that attaches the BPQ ports in JNOS

```
attach bpq init 0x7f 62
#
# This is the port (our port 4) referred to in the BPQCFG.TXT
attach bpq 4 node
#
# Now let JNOS work across this BPQ radio port (our port 1)
attach bpq 1 ax1
```

N.B. PACLEN in the BPQCFG.TXT is set at 236 !!

Hope this helps.

73, Gareth.

5525. Any access to "pbbs-net" from Internet?

Gee Carl... Where are all these whizz-bang super-duper techno-geniuses
that you work with every day? How come they're not up there on 1.2
gigaquadplex using those top-secret "I'd have to kill you if I told you
about it" high-tech modulation schemes?

Oh, sorry, I forgot. They won't "get licensed" because of that
nasty code test for access to spectrum below 30mhz... Pity...

Give'm HF access to save VHF. Yeah, that makes a lot of sense.

>worldwide allocation.

Is that relevant? A short while ago, bulletins similar to this
"Spectrum Defense Bulletin #1" were issued where the threat of
spectrum loss to little LEO was announced.
However, the so-called amateur band segments that were under threat
were not amateur bands in Europe, and have not been for a very long
time.

I think the US amateurs that are making all the noise should first
well realize that they already have much larger bands than anywhere
else in the world (e.g.: 2m is twice as large, 70cm is three times
as large than in other parts of the world).

Source record: 34026

I have a question. In AX25 Protocol for packet, my books show that
using a comma (,) in a path command is interchangeable with using
space v space. I/E unproto Joe,mars would route unproto tfc
via a digipeater with callsine "mars". The other way would be,
unproto Joe v mars (to do the same thing. Now some PC users seem
to use external software to control their TNC's instead of using the
software in the TNC ROM chip which conforms to worldwide ax25 standard.
These users say than cannot substitute a , in lieu of space v space.
They says they must use one space at least. Ex.
unproto joe ,mars. Whey is this? Is it a case of external
software overriding the ROM TNC defaults???. Some use Aplink, others
Wa7HML, etc etc. Some use pakrat 1 some pakrat 2. I dont use a pc
at all, but my unit will freely substitute a , in lieu of space v space.

>>I am currently using KPC-3 as my station TNC.
>>The software that comes with it is pretty simple and raw.

ATTENTION to Details BBS at 909-681-6221 has a demo copy of KaGOLD:
KADEMO.ZIP. I found it to be the finest TNC software available for
the KPC-3. Here's a piece from the Authors of KaGOLD:

About InterFlex Systems and the GOLD Software Authors
by Jeffrey Towle, WA4EGT - InterFlex Systems Design Corp.

Thanks for taking a look at this file. If you already own PkGOLD or KaGOLD
we want to thank you for your support. Other packet users contemplating
a software purchase should give our software a thorough review. PkGOLD
and KaGOLD are the most advanced software for AEA and Kantronics TNCs.

Our multi-connect software has been around in various forms for several
years. The Packet_TERM Shareware program that appeared on CompuServe was a
multi-connect program, dating back several years ago. Since that time,
we have taken the concept of multi-connect software to great heights.

The software developers, WB6UUT and WA4EGT are both professional software
designers. Lynn, WB6UUT is a pioneer in packet radio software, designing
the first packet radio BBS system that is still in use today. Jeff, WA4EGT
is also a software designer and developer with commercial clients in the
Fortune top 50 companies. Together, and with the many fine suggestions
from the growing number of users, we believe that Pk/KaGOLD represents
the most sophisticated packet and all-mode programs available.

When you deal with InterFlex, you talk to the developers. As packet radio
enthusiasts ourselves, we demand the best software with the most features.
Our users tell us that GOLD is the best program available, and by a
considerable margin. With only a few months of commercial advertising,
we have thousands of users, from all over the world, including Asia,
Europe, South America, and elsewhere. When we came out with our first
upgrade from Packet-PLUS, our users snapped it up and gave us rave
Since then, we have added many new features.

We were the first to support the new AEA ROM upgrade for the maildrop
in the summer of 1990. We were the first to do binary file transfer on
the same connect as keyboard to keyboard conversation (we were doing
that in 1989). At the San Diego ARRL convention, AEA representatives were
telling people to buy our product, and we thank them for their support.
We have the first program to support the Kantrnonics V 5,6 and 7 ROM FULLY,
with TWO binary file transfer protocols, conferences, and more features
than any other program.

When you compare features, keep in mind that with GOLD (any version) you get the largest scroll back buffers of any program (as big as available memory), and the most powerful and useful DOS Shell command (you can execute any DOS command, including Batch files from the PkGOLD or KaGOLD command line). Our multi-connect capability is well thought out, and easy to understand and use. We made our multi-way conferencing easy too. Now, you can support round-table QSOs simply and easily and not miss any text.

Pk and Ka GOLD offers you Quick-Connects(tm), and intelligent NET/ROM node hopping, which means you pick your quick-connect target station, and the program does all the waiting between NET/ROM node connects, sending the appropriate connect commands at each node and showing you the progress, as well as signalling you in morse code if you desire. Managing multiple connects with "Smart Session Management" means you can forget the idea of "stream switching" and let the program lead you to the next session automatically.

If you've ever wondered "What's going on" well wonder no more. With continual Network View monitoring, you can see in an instant what's going on, who's hogging the channel, and what's being said, all at the same time that you're carrying on multiple sessions and/or multiple conferences.

No matter what display monitor you have, GOLD provides the support you want. You decide whether to have 25 or 43/50 lines on your screen if if your monitor and display card support it. You pick the colors on all classes of messages (incoming, outgoing, cut/paste, command entry, status information, etc.).

The program comes with many options "defaulted" to the way we use the program, to simplify your initial use of the software. You can explore the aspects of the program you find interesting at your own pace. Installation is simple. But to install the program quickly, and get on the air, nothing beats PkGOLD or KaGOLD for simplicity.

If you're ready for something powerful, fast, full-featured, and fun to use, get our PkGOLD MultiMode or Enhanced, or KaGOLD Dualport. For Kantronics TNCs, you must have version 5.01 ROM or later, or for Data Engine, version 2.0 or later. We carry the Kantronics ROM upgrades so you can get the ROMs and the latest KaGOLD direct from us.

Use your credit card, send us a FAX, or call for information:

By now you probably got many answers. Of the many packages that you mentioned there is one more - Linux Operating System. It allows you to experience true networking beginning with WWW and ending on SMTP or POP or DNS. By using your radio and TNC you can learn how real networks interconnect and work and cohabitate. Linux is free and you'll probably end up with it. If not today then probably tomorrow:-)

well...i don't know if that's true. there's about 30 hams at our little corner of the design engineering group that's across the hall from us in publications. i don't think that's too bad a ratio...got about 5% of the overall population of the entire facility licensed, i believe that's above average too.

the days when someone can come up with improvements to basic technology such as radio in their garage is pretty much over. someone who can come up with this stuff can make serious bucks in industry, and many do.

Link distances in the microwave bands are measured in miles; 22,300 of
them is a common distance. I'd love to see about a MHz of space on a
Phase IV hamsat. It sure would be nice to have a couple of 56K
satellite links. Or, how about a nice megabit terrestrial network?

Source record: 34032

I dug out my old MFJ-1270 that's been packed away since I moved a couple of months ago. However, when I fire it up (bbRAM was reset in the move), I get the following (term program set for 7E1):

```
..RAM +.#... +.+ ..o#+++.
.A

MFJ ENTERPRISES INC TNC-2
AX.25 L.+.+ 2 V.....+ 2.0 + FAX
R.+.#.. 1.2.6 10/28/88 - 32K RAM
C ..+.++ $63
.+.:
```

If memort served, the first line is supposed to read:
bbRAM loaded with defaults

As you can tell, the capital letters (and numbers) are correct.

Turning LCOK OFF gives the following on powerup:

```
MFJ ENTERPRISES INC TNC-2
AX.25 LEVEL 2 VERSION 2.0 + FAX
RELEASE 1.2.6 10/28/88 - 32K RAM
CHECKSUM $63
CMD:
```

(Setting to 8N1 looks even worse.)

I recall having to play with some combination of word length and parity to get this working in the past. Playing with 8BITCONV, AWLEN, and PARITY have no visible effect.

Does anyone have any ideas?

(Also, does anyone know where I can get an updated MFJ ROM?)

Hi Josh,

The typical speed is 1200 baud. Extremly few people run 9600 baud. Of course you could lead us into the future. The problem with 9600 baud is ur radio cost will go up because it has to be 9600 baud compatable. Some stations do run 2400. If you want to run just the 1200 baud it is easiest. Plus 9600 baud tnc such at the KPC-9612 (kpc-3 equivalent that does 1200 and 9600) costs twice as much as the kpc-2 around $200. Let's see, $100 -$300 (depending on the functions) for a tnc, and anywhere from $150 - $400 for a 2 meter radio, again depending on what functions you want. If you want to do 9600 baud: about $200 for a tnc, at least $275 for a good mobile rig capable of 9600 baud operation. As far as the rest of stuff the other guy was right with his explanation.

5541. Re: HomeBrew TNC, want to Build

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-10-23 00:00:00 UTC
From: alan@g3kfn.avel.co.uk
Message-ID: <326e1c96.98127900@news.avel.net>
Source record: 34036

The KFN2 TNC is a Terminal Node Controller for Packet Radio (AX25) which works and functions like a TAPR TNC2 or MFJ-1270B. It can run firmware written for use with either of these two without modifications. It can be used for a Network Node using the NET/ROM Firmware from Software 2000 or TheNET from NORD>LINK. The KFN2 uses a single AM7910 chip from the 1985 ARRL handbook to replace the XR2211/XR2206 circuitry of the original TAPR TNC2. It operates at standard 1200 baud but with add on modems can be used at higher speed rates, such as 9600 baud. The board is entirely new and was computer designed. It has a solder resist and overlay to help make building it a lot easier. Full engineering drawings are supplied and also full instructions on building and assumes no previous experience so is ideal for a first time builder or novice. The board and full documentation including postage is available exstock at the UK price of Fourteen pounds or Eighteen Dollars American.

Edaine@uga.cc.uga.edu (ED) said through the grapevine:

>else in the world (e.g.: 2m is twice as large, 70cm is three times
>as large than in other parts of the world).

You should realize, Rob, that the frequencies the little LEOs are
after are precisely those international band segments, 144-146 MHz
and 430-440 MHz. They need a worldwide allocation. There are very
few of those in the VHF/UHF spectrum, and the amateur bands are the
only ones without large constituencies of financially or politically
powerful occupants. *You* should be making noise about this because
you don't have other parts of 2m or 70 cm to retreat to after the
little LEOs make their grab, but we do. This has the potential to
impact you much more than us. Though with our larger numbers, the
loss would still be very serious.

There are problems with on the fly compression in a lossy packet
network where out of sequence packets are fairly common. However,
you can certainly use strong block compression on the file externally
before transmission, IE arc, zip, etc.

Try removing JMP5 and allowing the RAM to completely discharge. This
might or might not help, but is worth a try. After changing AWLEN or
PARITY, you have to issue a 'restart' command.

You can get an updated eprom from MFJ, PacComm or TAPR. The TAPR 1.1.9 eprom will be a bit cheaper, but does not have a mailbox. If you have access to a eprom programmer, you can get the 1.1.8a hex image from ftp.tapr.org in /tapr/software_lib/tnc/eproms.exe (self-extracting file containing 1.1.8a, state machine and KISS images).

Talk was several years ago either shifting 40m up or down 100 or 150kHz =
and
giving hams a worldwide exclusive allocation. Last I heard the proposal =
was
something like 6.900 - 7.200 in all three ITU regions. Interesting =
though HF
broadcasters can change frequencies in-band much easier than we can...

One draft plan I've seen has amateurs relocated to 6.9-7.1 MHz exclusive
and the broadcasters getting 7.1-7.3 MHz exclusive. I don't know where
the plan relocates the current occupants of 6.9-7.0 MHz. This fullfills
the objective of the SW broadcasters to get more exclusive broadcast
frequencies (needed if they go compatible digital), and gives amateurs
a worldwide broadcaster free allocation. It is a 33% net loss for US
amateurs, however.

Wrong. It's because the FCC won't *LET* them use those "top secret 'I'd have to kill you if I told you about it' high-tech modulation schemes." The current Part 97 effectively strangles any meaningful use of new technology.

I'll bet if they did anyway you'd be first in line screaming to FCC Enforcement and your congresscritter about "illegal activities in the ham bands."

And people wonder why ham radio is so far behind the power curve. . .

Feh.

Paolo,

Check the web page: www.interflex.com

There is a KaGOLD version 8 testdrive there. It is not the latest program (ver 9 is the latest) but it does run, and will show you the basics of a Host mode program.

Version 9 runs well in all platforms, including Windows 3.xx, 95, NT, and OS/2. Being a DOS app has, believe it or not, some advantages, including the ability to resize the window and have the program screen rendered in a different font, so that the entire program is still visible. Winapps suffer from being resized -- they present scrollbars, and are not easy to run unless run in their full-screen mode.

For those who want to run multiple apps, and see what's going on, DOS apps in Windows is a good choice. Win 95, NT, and OS/2 are very good multitaskers, and well-behaved DOS apps are fast, and easy to use.

Win 95 does NOT do true pre-emptive multitasking. The multitasking
efforts of Win 95...especialy compared to NT and OS/2...is marginally
poor at best.

You need a 2.5mm and 3.5mm stereo-type mini phone jack.

On the 2.5mm plug:

1. feed mic audio through a .22 uf cap to the tip.
2. feed ptt through 2.2k resistor to tip
3. hook the shield and ground to the sleeve

On the 3.5mm plug

1. RX audio is hooked directly to the tip
2. Ground/shield goes to sleeve

The audio is fed through the cap (in the 2.5mm) which is DC blocked using the .22 uf cap. The unit transmits when the DC voltage at the tip is drawn down by a small load (2.2k) which doesn't clip the audio, it just biases the DC level down which causes the unit to transmit.

This trick of putting audio and ptt into the same point on the radio (one signal is AC audio and the other signal is DC bias) is also used on other handheld radios.

The RX audio is straightforward, and you can start decoding packets right away by wiring the RX audio jack (the larger of the two) while you figure out where to find some very small (1/8 watt resistor, and miniature .22 uf dipped caps). I've wired the resistor and cap in the 8-pin connector at the TNC end. My PK-88 works fine with my Yaesu handheld using this system.

Fact of the matter is that if we DID flaunt the law and go ahead and use
some of those techniques, chances are VERY good that nobody would
realize it until we decided to say "look what we did" ... however, the
average techno-ignorant pro-code fanatic will yell and scream and write
letters predicting how the bands will be trashed and the world will end
if we're ever allowed to use that "dreaded, new-fangled spread spectrum
stuff."

Now I'm NOT flaunting the law bu using stuff I'm not authorized to, but
I am working to change the rules so that these ridiculous prohibitions
are lifted ...

Hi All,
Anyone out there know of a good Multi-Mode Software (preferabley
shareware) to use with the MFJ-1278B Multi-Mode controller?
I tried MFJ's software (Multicom) and it is JUNK. Would not even work
unless you have a certian kind of video card.
Thanks in advance
73 de Tony (KD4K)

5561. Re: PACTOR II experience inquiry

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-10-24 00:00:00 UTC
From: Markus Lenggenhager <M.Lenggenhager@zrh.sc.philips.com>
Message-ID: <326F509D.740C@zrh.sc.philips.com>
Source record: 33907

Some days ago Jeff Towle WA4EGT made some comments about PACTOR-II. His bottom line was something like "if you are not a very fast typist, you don't need PACTOR-II". This is ridiculous!

It is well-known that only a small fraction of all PACTOR traffic is live QSOs. Much more is made up of individuals reading files from a BBS, or fully automatic S&F traffic between BBSs.

But even when neglecting the above facts, I didn't buy my PACTOR-II modem because of the higher throughput primarily. The most important improvement with respect to level 1 PACTOR is its robustness under weak signal conditions (S/N<0dB, QSB) and QRM/QRN.

Within the past 8 months I had contacts with all continents, using 10W output and a simple vertical antenna!

The second conclusion drawn by Jeff is indeed far-fetched: AFSK required by PACTOR-II is not as "clean" as the pseudo-FSK used for RTTY etc. Did you ever worry about "RF problems or other noise that gets into the audio circuits when modulating the radio with audio..." when using plain vanilla SSB? If you can handle SSB and know how to read your ALC meter and adjust your MIC gain, you're ready for PACTOR-II!

If I'm not mistaken, get an adapter from 25 pin to 8 pin and that
should work. Either that or get a cable with an 8 pin plug on the
computer's end of it.

The KAM only uses two states (digital modes) so you won't be able to get any greyscale info from it. It samples the audio x times per seconds (based on the WEFAX command argument) and simply decides 1 or 0 based on a 1700 Hz center frequency.

Does anyone know where I can get some help with a telephone line problem? Ma bell has struck out so far. Here's what happened. I went on vacation and everything was working ok. Came home and am having all sorts of weird problems. If we pick up a handset and hang it up other phones ring once. If you do it a couple of times in a row another phone may start ringing and not stop until you unplug it. I disconnected a couple of the phones and now it is ok.It seems like only three phones will work at any one time but if I add a fourth it starts acting up. One of the phones I use for packet through a Ham BBS but that is not involved in the problem. Any ideas would be appreciated.

>George, KQ7C

Hi George.

First, do you know if you have the newer interface box outside? If so, you can easily disconnect all your inside lines, and plug a regular phone into it. You can then see if your problem still exists either inside...or outside.

If the problem remains inside, its your problem...if it goes outside, it s on the phone co.s line, and they are responsible o fix it.

You also might try disconnecting different phones one at a time to see if just one is causing your problem inside. You might also want to note that ringers are fired with 90vac...so again, you can get a meter out while the phones are ringing, and start taking readings when they act up...which may help head you in the right direction.

Just my $.01. :)

Take care, and good luck.

> KH6JF

The comma and "v <space>" are used together when you want to digipeat
through more than one station (multiple hop). You would ust this
something like, C W1AAA v W1BBB,W1CCC.

The unproto command you show digipeats unproto stuff, which is different
than making a connection to another station via a digipeater. In this
case, your unproto joe,mars would set up the unproto path to cause any
umproto transmissions to be digipeated via mars.

Alvin,

There maybe many different things wrong with your station. The
antenna, transmitter power, devaition, and even TXD or other TNC
params. The best bet is to get a hold of some packet op in your local
area. He will be able to get your station configured to the local
standards and make it work well...

Great!

There are only 660,000 or so hams in the United States. This money
making spectrum should not be given away to just a few. If the ARRL and
the hams want the space let them bid on it. If the pro CW'ers who are
bent on code got together they could pay to have a code only spectrum.
Lets just see how bad the ARRL and hams in general want this specturm.
Like the old line says, "Money talks, Bull**** walks".

Oh dear, you are starting from ground zero, well we were all there once. Your computer should have 2 serial ports. They probably use DB9 connectors rather than DB25, however. Read your computer documentation to determine if this is correct. All you need is a DB25 to DB9 adaptor, available at most computer stores, to go from one to the other. Or you can rewire your cable with a DB9 connector, but note that the pin assignments are different for the DB9 and the DB25 when used for RS232. Most TNC manuals will have the pinouts for both styles.

It can be any number of things:

Does the HT actually transmit when the TNC keys it? If not, your
cable is wired incorrectly.

Are you trying to hit a site that has a transmitter powerful
enough for you to hear, but whose receiver is deaf?

Is your deviation set correctly?

Is your antenna system matched to the rig? Your HT may be dropping
its output power if the load isn't well matched to the rig.

You'll probably be much better off by asking a local ham to come
over and check your setup out. Alternately, try to find other
nodes that are closer to you, and see if you can connect. Diagnosing
these sorts of problems via the internet is generally hit-and-miss,
at best. :-)

Most PC's use DB-9 connectors these days. You need to get a cable
with a DB-25 connector for the TNC end, and a DB-9 connector for the PC
end, or alternately, there are DB-25 to DB-9 adapters available so
that you can reuse your existing cable. Any computer store will
have them.

> KH6JF

What you are describing is *not* part of the AX25 protocol. It is simply the behavior of the command interpreter of a particular implementation of TNC firmware. It varies from manufacturer to manufacturer.

The most common form, based on the TNC2 command set, is

connect W4XXX via KE4XX

The command interpreters generally let you type the minimum number of characters needed to uniquely identify a command, hence connect can be reduced to just 'c' and via can be reduced to just 'v'. Commas are just option separators. They are used to separate digipeater call signs when there is more than one digi in the command string, IE

c ke4zv v w4qo, kd4nc, wb4gqx

This means, connect to ke4zv via the digipeaters w4qo, kd4nc, and wb4gqx in that order. You generally cannot leave out the via keyword, or its abbreviated 'v' form, in a command string. Some implementations of TNC firmware command interpreters may allow that, but it is unusual.

This has absolutely *nothing* to do with the AX25 protocol, however. It is simply an artifact of the copycat nature of the TNC business that most TNC command interpreters follow the lead of the TNC2. If you were using a GLB TNC or a TNC with WA8DED firmware, the command string would be completely different, but the resulting AX25 packet would be the same. AX25 does not specify the command set or the behavior of the command interpreter. AX25 only specifies the form

of the transmitted packet.

Although I haven't done too much with lasers, I believe that the ham distance record is 60 km (I don't recall the mode however).

200 miles is definately out, but several miles is certainly practical.

I'm attempting a long distance (100 mile path) 10 Mbit path using 10 GHz Gunnplexors, but I think that 50 miles or so will be my practical limit. I'm dealing with a 2 degree beamwidth, which is much wider than a 0.05 degree beamwidth for a laser.

I've seen commercial laser network bridges above 100 Mbits, so the bandwidth is definately in your favor.

GOOD LUCK, Keep up updated!

I cannot speak for Carl. And I don't really care if the ITU keeps
the code requirement for HF or not. Regarding rule changes and,
equally important, an amateur radio incentive system that promotes
use and understaning of newer modes, I have written (snail mail)
and E-Mailed my congressman, the ARRL and the FCC.

But what is more important is getting radio amateurs to understand
and develop a curiosity about use and experimentation with these
new modes. If that can be done, maybe more people will write
or Email the appropriate authorities. I believe this is what
Carl and many others are attempting to do here. Until there
is some fundamental change in what the majority of the amateur
radio community feels is important (so as to stop the loss of
spectrum on the bands of the 21st century), things will continue
as they are and the status quo will remain.

Are there no-codes out here who have no-desire to experiment
and will jump on HF and do little more than yack if the CW
requirements are dropped? Definitely. And there are many
of them! Are there pro-coders out there who do little more than
"yack" on HF now?? Definitely. And there are many of them too!

I regret that too few people in this hobby (pro-code or otherwise)
are able to acknowledge severe problems in our incentive system or
recognize the things we must do (should have done?) to prevent loss
of these very useful portions of the RF spectrum.

Source record: 33926

I managed to install everything but:

I cannot monitor any TCP/IP transmissions from JNOS, but received packets from my Internet Connection are visible. The command 'IP Heard' remains empty.

If the NDIS3 interface in JNOS has its netmask set, Win95 reports 'Invalid Instruction'

I can't make heads or tails of this - I would appreciate any assistance from NOS experts to get things moving.

>stuff."

Once again (nothing new) there is no basis in reality for any of these
assumptions.

I, myself, have on numerous occasions stated that you would be better
off petitioning the FCC to modify the rules that hinder experimentation
than trying to get rid of the HF code test.

Of course, I know you would prefer to twist and warp reality to suit
your own little political agenda (the no-code HF license), but once
again, facts are facts, and >nobody< on any of these newsgroups has
even made a statement close to what you have suggested (unless, of
course, you'd like to provide the Message ID to support your claim,
but I know you won't, since you manufacture things out of thin air.)

>Now I'm NOT flaunting the law bu using stuff I'm not authorized to, but
>I am working to change the rules so that these ridiculous prohibitions
>are lifted ...

What does crying about not having HF access (which is >ALL< you do)
have to do with changing the rules to increase experimentation?

Once again, Carl, you're full of hot air.

>>time.

>Where did you get that idea?

If I remember well, the recent discussion about LEO was about a segment
at 420 MHz. This is not an amateur band in region 1, and over here it
is used for mobile datacomm etc.

>>I think the US amateurs that are making all the noise should first
>>well realize that they already have much larger bands than anywhere
>>else in the world (e.g.: 2m is twice as large, 70cm is three times
>>as large than in other parts of the world).

>You should realize, Rob, that the frequencies the little LEOs are
>after are precisely those international band segments, 144-146 MHz
>and 430-440 MHz. They need a worldwide allocation.

In some European countries, 70cm is only 432-438 MHz, and it is shared
with radiolocation anyway. Over here we have SYLEDIS in the 430-432
and 438-440 segments (due to an unfortunate attempt to move it from
the 430-432 to the 438-440 segment it is now present in both of them),
and in England the "pave paws" missile early-warning radar is well known
to cause a lot of trouble in the 435 MHz space segment.
Furthermore, there is an ISM segment around 433.92 MHz, and there are
constant attempts to allocate a 2 MHz segment for trunking radio systems.
Not a very suitable band to carve some worldwide spectrum from, it seems.

>few of those in the VHF/UHF spectrum, and the amateur bands are the
>only ones without large constituencies of financially or politically
>powerful occupants.

The 2M band is our only primary non-shared band. All others are either
shared or even secondary.

>73 de Tony (KD4K)
Initially I used a program that I wrote in BASIC and then compilled.
But I soon found that Xtalk allows you to program the Fn keys. Most
non-gui(Dos not Windows) communication programs allow you to
program the function keys. I only use my 1278 for receiving, so
(I do not have a copy of the "script" here with me) I used the
unshifted Fn keys to control VHF rtty (a lot of wx rtty is wide or
at least 450Hz shift) F1=mode VB,45,F2mode=vb,50, Then I used the Shifted
Fn keys for HF rtty, Shft-F1=mode HB,45. Alt Fn was used for Amtor and
CW I kept F9 and F10 as RXinv on /off. Since the 1278 has just about
the worst FAX or SSTV I did not bother to implement the FAX or SSTV
modes. (JVFAX with a simple op amp input "converter" gives much better
HF fax/sstv results)
An advantage of using a comercial com program is that the program can
cope with all the disk saves etc. I am jsut not dedicated enough to
master random disk i/o and make it "look pretty".
There used to be versions of Procomm as shareware and Procomm allows
scripts to program the function keys. I hope this gets you pointed in
the right direction.

In Denmark we have, what is believed to be, the world's only SSTV robot.
If you transmit a picture on its freq. it stores it. If you open it (with a
standard repeater 1750 Hz tone) it'll transmit the two last received
pictures (in reduced size).

5594. Linux routing help.... Please

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-10-25 00:00:00 UTC
From: "Alan K. Adamson" <ne1h@ne1h.radio.org>
Message-ID: <01bbc2ba$08a112a0$b7c41cce@typhoon.ne1h.radio.org>
Source record: 33940

All,

I have the following

subnet 206.28.196.xxx for 16 addresses, all ethernet based
rf gateway port on linux to 56K modem and 220 repeater
4-5 machines made up of windows 95, linux, jnos, etc

I want to be able to use the 56k modem (rf) port to route to some of the hams that I know that are also avail via that mode.

I want all of my computers to be able to access any of the other hams on the repeater

I can make the ip side of the routing work, but I can't make the arp/ax25 part work.

I have the following
route adding for another block of 16 addresses out the 56k modem port
default routing for the rest of my computers on the local lan

One other data point. The computer with the 56k rf port is linux and it works fine for the arp and the routing to it only, but if I route a win95 machine to those address on 220 via the 56k modem, the arp ends up being the mac/ethernet address and not the ax25 address for the 56k port.

How do I fix this, please, any help would be appreciated.

I think that many of us agree that the current licensing system needs
restructured. However, most "pro-coders" merely dismiss the blatent
"eliminate the code" solutions as narrow-minded and simplistic. Simply
eliminating the code requirement will not fundlementally change the
face of amateur radio.

>the hams want the space let them bid on it.

Sure, poncho. Let's put the whole thing up for grabs because the
polititians need to make some one-time-only sales to balance the
budget. You are a true free marketeer. Next we can auction of the
national parks and forests. After your local police and fire
departments "bid" on their pieces of spectrum, they can raise your
taxes to pay for it.

> If the pro CW'ers who are
>bent on code got together they could pay to have a code only spectrum.
>Lets just see how bad the ARRL and hams in general want this specturm.
>Like the old line says, "Money talks, Bull**** walks".

We should bid on all those VHF/UHF frequencies? Line of sight CW? Or
are you saying that the FCC should auction the international HF bands
as well. Every hear of the ITU and international treaties governing
use of those frequencies? Either way, I come up with nothing on this
one. Perhaps a little research would help before writing such inane
comments? To use your enlightened expression, Bull**** walks.

Do you have a callsign or did you just emerge from under your bridge?

5601. VHF/UHF SSTV Frequencies?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-10-25 00:00:00 UTC
From: johnl@world.std.com
Message-ID: <Dzu9r0.4Jt@world.std.com>
Source record: 33947

Many people still think of SSTV as an HF activity, but
from conversations with many people it is clear that most
of the recent growth is on VHF. Although the recommended
2 meter frequency is 145.5 MHz, many regions are using
different frequencies because they are using repeaters.

I've started compiling a list of these frequencies and
net schedules but still have a long way to go. If you are
using SSTV on VHF or UHF, I'd be very grateful for the
following information:

Location (city/state/country):
Frequency (above 30 MHz only):
Input Frequency (if repeater used):
Days and times of local nets:
Information source (your call if you want to be
mentioned as the information source or leave blank):

Please respond by e-mail to JohnL@world.std.com rather than a
followup to this post. I will publish the results after placing all
the responses in a table.

Thanks & 73, John WB2OSZ

5602. how to reduce qrm orginating from pc ?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-10-25 00:00:00 UTC
From: lex van der lugt <lex.van.der.lugt@tip.nl>
Message-ID: <01bbc2a6$f6808c80$2127b18f@lex.tip.nl>
Source record: 33948

Hello digi-ham's,

My station consists of a atari st - computer, a pk-232, a kenwood ts-820s
and an open wire dipole.
I am having the problem that the computer generates S-5 qrm on 20 meter
band, so i miss a lot of weak stations.
Has any of you experience in eliminating this computer-made noise ??
ie. will switching to a pc help ?
what pc do you use ? are you having the same problem ??

any help appreciated either in this group or direct to my e-mail address:

EXACTLY ... I am NOT just "fighting for no-code" ... that's part of it,
but it's MUCH more than just that ... I'm trying to stir a rejuvenation
of the spirit of what ham radio is *supposed* to be about ... that's
where we have BIG problems and how we'll lose our bands ... it's not
JUST CW it's that and more ...

>Until there
>is some fundamental change in what the majority of the amateur
>radio community feels is important (so as to stop the loss of
>spectrum on the bands of the 21st century), things will continue
>as they are and the status quo will remain.
>
>Are there no-codes out here who have no-desire to experiment

Tommy,

If I'm correct, and anyone else can correct me on this, you would probably need to use BPQ 4.07 or later to use the scc card with FBB. Check out the setup instructions for BPQ about this but I think that BPQ 4.07 and later do support the scc cards.

5610. ax.25 tsr's under windows? (Or how do i use my baycom with tcp/ip and windows)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-10-26 00:00:00 UTC
From: stimpson@biddeford.com
Message-ID: <54s165$blf@noc1.biddeford.com>
Source record: 33956

Hello. I am new to this group. I have been on packet for about 2 years. I am a major fan of the (baycom) method of packet radio. I do not wish to purchase a tnc that uses a TRS-80 cpu (Z80) when my pentium can handle the job a 1000 times over. My problem is with my operating system. I switched to windows 95 about a year ago. Before that I was running dos. I have been away from packet since i switched operating systems. I used a tcm3105 based modem, the ax25.com tsr, and the ka1nnn modified jnos for my packet operations. My problem is that I cannot get ax25.com to run under windows. I hear this has been a problem for many others, including people who use ethernet tsr's.

My question is: are there any ax25 tsr's that will let me use my baycom modem with jnos while running windows?

Have they finally given in and produced a tcp/ip packet radio program that uses windows as its native os?

OR..Have they finally ported jnos over to windows? As in a windows only amateur radio tcp/ip program that will trace in one window, allow commands in another window, and let you choose either the baycom method or the tnc method of operation merely by selecting it from a setup program?

I just spent 2 hours on the World Wide Waste (of bandwidth) and could not find any info on windows and baycom.

Tnx for any replies>
Steven

Mac computers are very good in being low noise too - and the older
models like Classics, SEs, etc. with the built in monitors have
small footprints so if your shack is cramped for space, they help
keep a compact theme.

If you need ham radio software for the Mac, look at my home page.

5624. 1270C Tx audio low with HT?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-10-27 00:00:00 UTC
From: btbanko@prairienet.org
Message-ID: <54vsh4$i0l@vixen.cso.uiuc.edu>
Source record: 33970

I have just gotten an MFJ 1270C TNC which I am trying to use with my Standard C158A/Heathkit HW2M HT, and it seems to work OK, but my Tx audio is low by report (especially compared with that with my Baypac-1 modem).

I have to use the "Jmpr L" to link the PTT to the Tx audio line with a resistor... the schematic suggests that this resistor should be a 47K ohm, but on the board it is a 4.7K. In addition, the audio coupling capacitor is supposed to be a .33 uF (I don't know which value exactly is on the board). Standard recommends a 1 uF cap and a 22K resistor.

Should these value differences be causing the low audio?

Thanks in advance for your comments.

My suggestion would be a Sony Magic Link PIC-1000. Besides all of the neat stuff it has built in (like Modem, software, etc.), it has a serial port which you can use for communcation purposes. The free software CujoTerm is a terminal emulation software (there is also a VT-100 emulator by RiverRun software). It weighs less than a pound, and is about the size of a paperback book. Besides hooking it up to a TNC, you can use it to check your land-line based e-mail, surf the web (with additional software), spreadsheet, notepad, datebook, and even games. Supposedly the Fry's in Palo Alto is selling them for $199. If you have the cash, go for a PIC-2000 (more memory, bAcklit screen) for $499. I am a PIC-1000 user and ti works great (just starting to learn about packet though).

You may have a ringer equivalency problem. One old "Bell" style phone =
1 ringer. Some phones can = 2.0 and some .5 . Most phone companies will
support upto 5 ringer equivalency per line. If you are on the outer
limits of the central office your line may support less ringers because
of loop resistance. This can cause what I call loop limit bounce. You
lift the handset and replace it. The surge and drop of voltage is stored
and released from the caps attached to the bell. Hence the bell rings.
Bad telco equipment can cause this trouble as well. It may also be that
you are recieving Ring voltage bleed-over. Listen for crosstalk on the
line or a rumble of ring voltage while on a call. Good luck, call Ma
Bell and complain until you get action.

5631. CASH FOR RADIO SUPPLIES

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-10-28 00:00:00 UTC
From: "Conrad R. Dery, Jr." <conradjr@bright.net>
Message-ID: <01bbc483$d2664c20$8c74d4cd@default>
Source record: 33977
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.boatanchors,rec.radio.amateur.digital.misc,rec.radio.amateur.dx,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.amateur.policy,rec.radio.amateur.space,rec.radio.b

Take a few minutes and read this. It could change your life!!!!

This is your chance to earn BIG BUCKS

This is for real....no gimmicks!!!

I read this article from a news group telling me I could make $50,000.00 in
as little as a month from an investment of only $5.
It sounds like a scam but it is legitimate. If you doubt it check out
Title 18 section 1302 of the U.S. Postal service and regulations.
It is --NOT--ILLEGAL--IT IS NOT A --CHAIN LETTER--IT IS TOTALLY
LEGITIMATE!!!!!!!!!
I decided that an investment of only $5.00, 5 envelopes and 5 first class
stamps was not going to break me even if I didn't receive any money back.
I can't guarantee that you will make money, who can, but the chances that
you won't are extremely small.

So here it is.....The procedure is simple

First.

Write your name and address on five separate sheets of paper.
Next write "Please add me to your mailing list" on each piece of paper.
Fold a ONE DOLLAR BILL in each piece of paper and mail one to each of the 5
following addresses:

---

1. ERIC FINCH, P.O. BOX 245 LUFKIN, TX 75901

2. KIP GRIFFIN, 349 W. WEBSTER, MUSKEGON, MI 49440

3. PETER SIMMONS, 668 CLAY #118, SAN FRANCISCO, CA 94111

4. JOE D'BELLA, 4611 TWISTED OAKS DRIVE #1916, RALEIGH, NC 27612

5. CONRAD DERY, 817 N. WASHINGTON ST., VAN WERT, OH 45891

Second

Remove the first name on the list and move the other four people up. For
example (5 becomes 4, 4 becomes 3,) etc....
Put your name and address as number 5
You can do this by re-typing this article or edit it and re-post it.

Third

Post your amended article to at least 200 news groups. This may seem like
a lot but it is easy to post to more than one at a time and there are over
17,000 different news groups so there is no shortage of space to post. The
more news groups the better your chances of being seen.

CONGRATULATIONS!!!!!!!!!!

You are now in the mail order investment business.
You will start to see results within 7 to 14 days
Remember, the more news groups you post to, the bigger your return will be.
You may want to get a post office box to handle all of your mail.
If you wish to remain anonymous you can use a pseudonym such as "The
Manager" or "The Investor", but be sure your address is correct!!!

How and Why the system works.

Out of every 200 postings you make you receive an average of 5 replies,
each with a dollar bill enclosed. Yes only 5, as an average.
It looks small at first but when you analyze it you see the beauty of your
investment.
With 200 postings you make $5.00 with your name at number 5
Each person who sent you $1.00 now makes at least 200 postings with your
name at number 4.
You have made $50.00
Your 50 new agents make 200 postings each with your name at number 3.
Now there have been a total of 10,000 postings. The average return is 500
at $1.00 each is $500.00
They make 200 postings each with your name at number 2.
Now there are 100,000 postings with your name on them.
Now expect 5,000 returns at $1.00 each...WOW $5,000.00
Finally 5,000 people make 200 postings with your name at number 1
You get a --$50,000-- return before your name drops off the list.
AND THATS IF EVERYONE ON THE LIST MAKES ONLY 200 POSTINGS!!!
Total possible income in one cycle = $55,555.00

From time to time, when your name drops off the list, you take the latest
posting that appears in a newsgroup and simply add your name and another $5
and your back in.

Remember 200 postings is only a guideline
The more you post, the more you receive

REVIEW

The cost to you--$5.00 + 5 stamps + 5 envelopes

There are millions of internet users and hundreds of thousands of new
customers every month which gives you millions of prospective agents.

17,000 + newsgroups to post your article to.

Read the instructions carefully and act fairly
That is the only way the system will work properly
Keep a list of everyone that sends you money and monitor the newsgroups to make sure everyone is being fair
Print this out and refer back to it in the future.

Get ready to make the easiest money you have ever earned!!!!

Enable CONFIG_EXPERIMENTAL and CONFIG_NET_RADIO
It _compiles_ under 2.0.12, but there were some bugfixes
in 2.0.14 I think, so you'll better upgrate to that.

Try the Linux Kernel Baycom driver, just say 'yes' (or 'module') to:
CONFIG_EXPERIMENTAL
CONFIG_NET_RADIO
CONFIG_BAYCOM
and use either Kernel AX.25 or any user mode AX25 stack, such
as TFKISS, Wampes, TNOS and others...

> Thanks,
> Ed Burress
> KC7GFX

The method to use is detailed in five text files which you will find in
the DOS APRS distribution, in the README subdirectory. They are:

mapmakin.txt
maps.txt
maps100k.txt
maps-cd.txt
mk100k3.txt

If you like, please email me direct and I'll explain the process in
detail - but please read those five files first!

DOS APRS maps will work in WinAPRS, just put a copy of them in the
WINAPRS/MAPS directory and start WINAPRS. WINAPRS maps DO NOT work in
DOS aprs...

The reason the Portland maps aren't complete is that I didn't give Keith
Sproul a wide enough coverage area when I asked him to generate them.

Hi,

a friend and I want to buy a boat and travel around the world, but not without an internet connection to our Linux boxes! Given that Linux supports AX.25 and Net/ROM, what are our options?

1) Is it possible to get satellite downstream and packet radio upstream, worldwide?

2) If not, which speeds are possible over duplex packet radio?

3) Are there any world wide packet radio ISPs, or do you have to hop from one to the next?

4) Or would private radio hobbyists forward your traffic to your ISP?

Any help apprecidated,
Axel

>

This is your fundemental error. Your operating under the false
assumption
that somehow you can promote change from "within". I think the ignorance
and name calling we see from many of the "so-called" pro-coders should
convince you that attempting to change the minds of the "olde phartz"
as I believe you call them, is a waste of time. Look to the visionaires,
the people you so often cite. Get them to write congress. You *don't*
have to be a 'ham' to get the rules changed. Carl, your fighting a war
of attrition. Stop wasting your time battling windmills. Hit up the
computer folks, write some proposed legislation, etc.

I too would like to see the "rejuvenation of the spirit of ham radio"
but
I know it will not come from within. The 'spirit' you seek is out there,
its
just going to have to come from outside. Ham radio today is just
glorified
CB... and I've even seen CB'ers that are more willing to
experiment/modify
there rigs then most hams. These are the folks that are causing the rot
of the service.

Push the service to the computer folks. Digital and spread spectrum is
were
it is at.

I'm not sure this is what you wanted to here, but just my two cents.

Best regards,

Jeff wb8wka

Welcome, technomad! Take a look at http://www.microship.com/ for info on the latest project of the original technomad, Steven K. Roberts (of Winebiko and BEHEMOTH fame). He can probably tell you what the best way is.

Make sure you have a digital camera and keep a web page updated!!! ;-)

Have fun,
Omega

Have heard NO rumor's at all that a new DOS version is coming out.

Present DOS version is v5.15c i thk. He has released a windows version
v.7.00a, and there IS a version due out shortly for LINUX.

5648. FBB5.15c forwarding problems

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-10-29 00:00:00 UTC
From: skoric@uns.ns.ac.YU
Message-ID: <19961029230543.13831.qmail@uns.ns.ac.yu>
Source record: 33801

Hello folks,

I want to know how to make a specific group of bulletins to be forwarded before the other groups, and in this specific group the smaller bulls at first, then the longer etc. I tried to use both T S (=smaller first) and U n (n=name of TO field) commands in my FBB FORWARD files, but it seems these commands are not likely to give the result I want. Any opinion?

73 de Misko YT7MPB@YU7APV.SRB.YUG.EU -or- skoric@uns.ns.ac.yu

>of operation merely by selecting it from a setup program?

> I just spent 2 hours on the World Wide Waste (of bandwidth) and could not
>find any info on windows and baycom.

There is a windoze 95 driver for baycom modems, it runs OK, but the
associated COMM program that runs with it leaves alot to be desired.

There is no tsr, and the driver is written to CHECK the incomming data
from the baycom VERY OFTEN. The result is that there is no tsr, so
windoze and windoze 95 doesnt trash it.

The data line from the baycom is checked very often, it doesn't miss
packets. But, it does SLOW down the 'puter bigtime during reception of
packets. It is pretty harmless EXCEPT during periods when a packet is
present on the baycom output. During these times, your computer STOPS
doing everything else and is totally dedicated to decoding THAT
packet.

It's only for a second or 2, but if you are running other apps, the
delay seems like its forever hi hi.

Indeed, this is the major attraction of PACTOR II (and to a lesser extent of Clover). In robust mode, they work at very low CNRs. Note, however, that the -18 db CNR quoted for PACTOR II is in a fixed rectangular bandwidth and not in the matched filter bandwidth. The actual Eb/No is, of course, greater than zero. In fact, it's about 11.5 db. That's about 7.5 db stronger than the best current weak signal technique (used by NASA). So there's still room for improvement over what PACTOR II can deliver.

I love the fact that I can use a pipsqueak transmitter and a crummy antenna and still get perfect copy on signals from all over the world, signals that often can't even be detected by ear (and I'm only using Clover, which gives away 14 db to PACTOR II in ultimate low CNR performance). I'm eagerly awaiting a promised price reduction for the PACTOR II box (from PacComm). Right now it is a bit dear compared to the other boxes. OTOH, I'm also looking at Karn's work with a sound card and PC. That may be as good, and not require an expensive standalone box.

The big problem with Clover, PACTOR II, and even more so with Karn's work, is that there's not a large installed base out there yet. So the opportunities for contact aren't as great as desired. What Karn is doing has the best potential for large scale adoption (IMHO), because, like Baycom, it requires very little additional investment to become operational. The downside is that it offers no backward compatiblitiy with other modes. The P-38 and the SCS box offer PACTOR I, AMTOR, and RTTY fallbacks so you can also work the currently much more numerous stations still using those methods. Of course there is other software out there which does RTTY with a sound card. I haven't heard of a pure software PACTOR I program using a sound card interface, however. Anybody know of one?

>they will never be anything more than what they are today.

Alas, even when there is commerical gear (and there is), the mindset of many current amateurs won't let them adopt newer methods. For example, the 56 kb RF modem has been available for *8 years*, yet only a few thousand are in use worldwide. The same for the P-38 Clover card and the SCS PACTOR II box. Even with equipment that is virtually plug and play, we get the same lame excuses such as "I can't type that fast." What the hell? I guess they access the internet with 110 baud modems too, since 300 baud is faster than they can type on their VIC-20s.

>
>Should these value differences be causing the low audio?

47k is a typo in the manual, 4.7k is correct. Actually, this resistor value can vary from 2.2k to 10k depending on the radio used (some radios require a lower value leak resistor than others to key reliably). A .33uF cap is big enough, it only has a reactance of 402 ohms at the low tone, so the ten times higher impedance of the "leaky PTT" resistor shouldn't be loading down the audio.

I assume you've adjusted the Tx audio level pot. You should be able to get over a volt of audio out of the TNC (unloaded). That's about 20 times more than you need to drive the radio to 5 kHz deviation. Check it with your VOM (AC scale). If you can't get a volt of audio out of the TNC, you might check for a Hi-Lo audio output level jumper in the TNC. I don't recall if the 1270C has one or not, some TNCs do.

From: ken@g4mpq.avel.co.uk
Message-ID: <327576ec.30515028@news.avel.net>
Source record: 33994

I've already built a couple of TNC's designed by G3KFN. The boards are thru plated and are solder resisted. They have alll the necessary info overprinted on the pcb for easy assembly. My kits included circuit diagram, physical layout and component charts together with an idiot sheet to identify all these daft new markings on components, and I really appreciated the information too! Both mine worked very well indeed, but I do know that the designer of the KFN2 [Alan Baker] does provide a very good 'phone-line' help service on 01752-770045 if you get in to trouble... Hope that helps de Ken

One option: maintain a prepaid account on an ISP and use an INMARSAT
terminal to dial into your ISP wherever you are. Expensive (at something
like $5K for the box and $2-3/minute for your INMARSAT time) but reliable
to the max.

>is used for mobile datacomm etc.

They're looking at lots of options. But the ones of concern to us are
the international 2m and 70cm allocations. They are currently operating
at 149 MHz and at 453 MHz. It would make the most sense for them to get
a nearby allocation for expansion. The 2m band, especially 144-146 MHz,
is one target, as is a slice of the 70cm spectrum. 440-450 MHz is shared
with naval radar and wind profiler radars, so it isn't a very good candidate.
420-430 MHz, as you note isn't an international allocation, which would
complicate the politics enormously. That leaves the 430-440 MHz slice as
most attractive to the little LEOs.

>>>I think the US amateurs that are making all the noise should first
>>>well realize that they already have much larger bands than anywhere
>>>else in the world (e.g.: 2m is twice as large, 70cm is three times

>and in England the "pave paws" missile early-warning radar is well known
>to cause a lot of trouble in the 435 MHz space segment.

I'm *very* familiar with PAVE PAWS since there is one in the neighborhood here. It is a FH system that adapts to other signals on the band. It has actually proven to be a reasonable sharing partner. It's those blankety-blank P3 Orions with their buzzsaw radars which create all the problems on 70 cm.

>Furthermore, there is an ISM segment around 433.92 MHz, and there are
>constant attempts to allocate a 2 MHz segment for trunking radio systems.
>Not a very suitable band to carve some worldwide spectrum from, it seems.

435-438 MHz is the closest thing to a worldwide allocation in this region of UHF. It would be the likely primary target of the little LEOs for a UHF allocation. We *know* it will work for a LEO since *we're* already using it that way.

>>few of those in the VHF/UHF spectrum, and the amateur bands are the
>>only ones without large constituencies of financially or politically
>>powerful occupants.
>
>The 2M band is our only primary non-shared band. All others are either
>shared or even secondary.

That's correct. 2m is a primary target. A segment of 70cm is also a likely target, and the 435-438 MHz segment in particular is the best candidate because it offers the least powerful political consituency to defend it. You've got to realize that a reallocation won't be based primarily on technical issues. It will be a political decision, and that will revolve around whose ox is gored and how loud they can scream.

>Once again (nothing new) there is no basis in reality for any of these
>assumptions.

Incorrect. Read the comments filed with the FCC opposing relaxation of the spread spectrum restrictions. You'll find all the comments, pro and con, at the TAPR website. The "pro-code fanatics", aka traditional weak signal operators (there are better ways to do weak signal operation than OOK Morse, but they refuse to adopt them), have been vehement in their objections to relaxed SS rules, stating that such activity would indeed "trash the bands". And the repeater coordination neo-luddites have been just as vehement, and just as wrong. Their comments would be amusing if they weren't so pathetic. It would seem that none of them know the difference between energy and peak power, or how to evaluate either in a fixed bandwidth.

Their intent to maintain warehousing of spectrum with low utilization is clear. In essence it is a NIMBY response. Spectrum studies have shown that our most heavily used band is only at 20% occupancy at peak usage, yet the neo-luddites don't want to allow that 80% vacancy to be filled to any degree at all. And note well that the FCC has stated publicly, in another context, that warehousing of spectrum will no longer be tolerated.

Note, SS is not the only way to use that 80% vacancy, more efficient narrowband techniques could exploit much of it too, and would be perfectly legal under current rules. However, the level of co-channel and adjacent-channel interference would be very much higher, requiring existing users to make major changes in their stations and operating technique that wouldn't be necessary if SS is allowed. And a much higher degree of formal coordination would be required as well. But of course the NIMBY crowd doesn't want to see any amateur activity growth at all. To them, the bands are full now.

Nothing much has changed in regard to amateur attitudes since 1937
when higher speed Morse tests were first acknowledged by an ARRL
author to be primarily a rationing method for spectrum access. The
attitude has remained to restrict access rather than improve technique
to accomodate growth. No wonder others are eying our bands, they are
at least four fifths underutilized when viewed by those willing to
use "modern" techniques. And those techniques aren't all that modern,
SS was developed during WWII by Heddy Lamar (remarkable woman, but
that's another story), and used on the Roosevelt-Churchill "hotline"
(actually a HF radio circuit).

>Has any of you experience in eliminating this computer-made noise ??
>ie. will switching to a pc help ?
>what pc do you use ? are you having the same problem ??

My experience with the Atari is limited, but quietening appears to
be hard. You can quiet a PC, it just takes good UHF shielding practices,
IE lots of screws, bare metal to bare metal contact, etc, and strong
suppression on cables entering and leaving the shielded area. The monitor
is actually the hardest thing to shield properly because they all seem
to come in plastic cases these days. Use of copper foil tape or conductive
sprays can quieten them, however.

If you haven't already, there are steps you can take to quieten the
PK-232 too. They are often very noisy. Again, get bare metal to metal
contact along the case seams, use lots of screws, one every 2.5 cm of
seam. Suppress the cables with ferrites. The usual drill.

WOW! Can you imagine the monthly birdy bill from INMARSAT on a PERMANENT marine connection? Hmm...let's see...$10/minute X 60 X 24 X 31 X 12. Billy Gates could have this.

>1) Is it possible to get satellite downstream and packet radio
>upstream, worldwide?

If you are thinking about packet radio on HF, you are looking at perhaps 300 baud maximum. HF radio is VERY noisy. Computer parts HATE noise, as I'm sure you know. I am a ham radio operator. We have been using packet radio on HF for many years. FCC limits us to 300 baud because HF is very crowded and they INSIST that we stay to the bandwidth of ONE SSB voice channel (about 3Khz). Good luck.

>2) If not, which speeds are possible over duplex packet radio?

300 baud on HF, 1200-2400 baud on VHF.

>3) Are there any world wide packet radio ISPs, or do you have to hop
>from one to the next?

Internet on long range HF radio would never happen. Connect to your ISP, if he'll let you, at 300 baud. This would be ideal HF conditions, no noise. Your favorite home page MIGHT download in a day. No way, Jose.

>4) Or would private radio hobbyists forward your traffic to your ISP?

Ham radio operators have a worldwide packet radio BBS system that can be accessed from ANY boat equipped with a licensed ham radio operator and an HF ham radio station. There are several frequencies on the different HF ham bands that allow user access via HF. Many systems are used STRICTLY for mail forwarding. This system is the very simplest of bbs email and is only connected to other ham radio stations, not the internet. Internet's HUGE load of data would swamp the HF system to make it totally useless.

As another note, Bob Bruninga WB4APR at the US Naval Academy, has invented a fantastic packet radio GPS reporting system in use by Navy

ships and ham radio operators worldwide. A special GPS compatible firmware is installed in the boat mounted packet modem (They are only $100) which transmits the GPS data to anyone who can monitor them with Bob's program (APRS, it's called). The program, and packet radio, work great on HF and VHF radio. I can track the Naval Academy's sailing vessels and other craft from here in Charleston, SC almost anytime. The program displays ship speed, position, type, name, direction of travel and is capable of keyboard to keyboard communications between stations. It also has an amazingly good broadcasting function which allows any station using the PC program to enter system-wide announcements and bulletins to all stations. The receiving stations' programs have special windows where these are stored and displayed. Now, wouldn't this be a neat way of reading NOTAMs?

It's a pity APRS has not been implemented by the government bureaucracy for the safety aspect of having an aircraft type beacon system in the marine environment. Any station not reporting in every X minutes automatically could trigger an alarm. Emergency communcations is already built into the system. Shame it's not on YOUR boat.

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-10-30 00:00:00 UTC
From: Rob Dover <rdover@mail.netshop.net>
Message-ID: <3277C1AE.4127@mail.netshop.net>
Source record: 33820

Greetings..
We have several X1J4 nodes around here that all seem to be exhibiting a
strange problem. Occasionally they seem to go deaf. It is as if they
are
just not receiving anything on the radio ports. Sometimes a RESET ALL
will
bring them back to life and sometimes they will come back on their own
after
a while.
They seem to communicate just fine through the serial ports even when
the
radio port is dead. The transmit side is fine as the nodes still send
out
id's and node broadcasts as normal as well as connect requests etc.
entered
from the serial side.
Anyone else seen this or are my nodes haunted?

Those who will even admit that there are better methods tend to say
that. Though "I think I heard an 'M', or was that just the furnace
kicking on?" doesn't seem like much of a contact to me, I suppose
some people enjoy it. I don't begrudge them that enjoyment. But
I know one fellow personally who spends months getting ready for one
of the "tests". Somehow I think he enjoys the planning and station
engineering more than the actual event (he certainly talks about it
more), and I suspect that if he felt comfortable with digital technique
he'd enjoy planning and setting that up too (and would crank the power
down or prune back the antennas to bring the RF engineering challenge
back). But if listening to noise gets the weak signal crowd off, then
adding a little SS noise should make it just that much spicier for them.
It'd add to the challenge, and hence the "fun". If they had real messages
to convey, or if they were *really* serious about working weak signals,
they'd adopt the better methods.

Note, I generally admire the weak signal crowd for their RF engineering
expertise. It just seems a pity to waste all that talent on such a poor
signaling method.

>'heavily used'.

That figure came from Lyle Johnson's talk at DCC, and was an upper
bound. It's fairly easily confirmed, all you need do is monitor for
24 hours with a spectrum analyzer from a good site. The amount of
vacant spectrum is astounding for a band which is supposedly "full".
A full band would have every Hertz fully utilized all the time. Even
with the inefficient modulations in use, that's not even close to true.

Not even at peak usage times.

>: to accomodate growth. No wonder others are eying our bands, they are
>: at least four fifths underutilized when viewed by those willing to
>
>I know the VHF+ bands are being eyed, but was unaware that HF is being
>coveted by other services. Could you tell me who they are?

Well, of course I was addressing the VHF+ spectrum, since that's
what the current SS rulemaking is about. But if you want a threat
to HF, I already mentioned "compatible digital" broadcast (which
really isn't compatible with anything but the broadcaster's own
signal). Field tests have already been conducted for the FCC by
a consortium of broadcasters and equipment manufacturers (last
winter in Cincinnati). The immediate target is to get the system
deployed on the Standard Broadcast band because FM is eating their
lunch, but there's considerable interest among SW broadcast operators
as well.

Both the industry and the government acknowledge that the planned
move of SW broadcast to SSB is a dead issue. CD is the road that
offers them a way to remain competitive with the soon to be deployed
satellite DAB systems, but they'll need more exclusive spectrum to
pull it off. This is almost certain to be raised at WRC99 if it
doesn't sneak into WRC97.

Also, I know of a contract a manufacturer has with a major long
haul trucking company to develop a HF truck tracking system that's
cheaper than the LEO system proposed by those guys after 2m and
70cm (cheaper because *there's no recurring usage charge* since the
ionosphere is free). That'll need spectrum spaced so that the MUF
can be followed for a number of medium and short hop paths in the US.
It'll use ALE techniques for sure. My source didn't say if it'll also
be SS, or whether it'll use narrowband packet techniques (I suspect
the latter since the company has expertise in that area). In either
case, it'll need several spectrum slices, probably below 15 MHz.
This one use probably won't impact the amateur allocations at HF
directly, but if it starts a trend among those with cost sensitive
applications which need low rate data over medium to long distances,
well there goes the neighborhood.

Gary

5678. EPROM's in Data Engine?

Date: 1996-10-30 00:00:00 UTC
From: lazeraud@sentex.net
Message-ID: <557aqr$1v0@flint.sentex.net>
Source record: 33824

Greetings!

We have 2 Data Engines using 4 9k6 modems. About a week ago, 2 of the
modems went dead and after some testing, we found that changing the
TX eprom would restore the TX deviation, but the RX is still weak (I have
to drive the modem @ 7Khz deviation to get the DCD LED to light)?
Changing the RX eprom had no effect.

Any ideas??????

bcnu,

Yeah, Mike, but think about all the QSL cards you won't have to fill out.
The other thing I haven't figured out is with Squiggies hi-tek below the
noise floor digital goober box, how the hell do you FIND anyone calling
CQ if you can't hear them ?

>while his classmates are selecting Pentiums.

Correct, but technology always gravitates toward the money, even
if the YL has to choose between putting up a repeater or just
talking to one!

:)

>Hams Use:
>Packet Radio - with 1200 baud TNCs so their ASCII text files can
>snarl their network and their TCP/IP portion moves binary data at the

Check into the merging of amateur radio with wireline... Visit
the OH2BU cluster site on the web and see a really interesting
merge of even 1200 baud technology with it. The Telnet
into the New Orleans cluster and watch the show.

>The Hobbyist/Commercial Service Use:
>Internet - with typical 28,800 baud modems so their files fly. Some

>per month. Less than the cost/month of what most hams spend for a
>HF rig.

Per Boardwatch magazine, the average IP now has over $1,200,000
invested in the operation, and over $100,000 in software. It is
true that you can do the software bit for free with LINUX and a
486, which, per Paul Sittler is, "A terrible thing to Wais", but
without some kind of financial offset, few hams can afford the
$700 + 2000 plus per month it takes to offer the connectivity
you cite. You *CAN* get this performance from upstairs by
radio *IF* you wish to pay for it!

>Hams Use:

>cellular phone, guess who is going to get help to you the fastest?

It all depends on the emergency. Ask the folks in Oklahoma City
about the value of having BOTH around. Try replacing a cell phone
site with a temporary site in ten minutes. Check QST magazine
for the details... along with years worth of lives and property
that really have been saved and protected.

Have you ever tried to program an 800 Mhz trunkline radio...

especially on the fly in a genuine disaster so that alternate
communications networks can be created when really necessary?

>The Hobbyist/Commercial Service Use:

True. <chuckle>

>The Hobbyist/Commercial Service Use:
>Internet with a WAN perspective where satellites and fiber optics
>negate propagation phenomona to anywhere on the globe.

But not necessarily relative to the comparison above.
Internet is presently predicated upon hard wired connection
for the masses. The comparison made only serves to
illustrate why the RF medium is possibly valutable and, as
you will note, commercial equivalent of it is VERY expensive,
even at 1200 and 2400 and even, gulp, 9600 baud to your
laptop!

Right?? :)

>Hams Use:
>Orbiting satellites that takes thousands of dollars to use.

Not always true. A packet message to Europe from my FidoNet
BBS gatewayed into the amateur radio PBBS world and addressed
properly gets delivered for absolutely no money to me as a ham
to the party in Europe, likely..... by satellite....

But then, who paid for AmSat? <GDRFCover>

>The Hobbyist/Commercial Service Use:
>DDS TV geostationary satellites that cost less than $300 to use.

>hams don't want to build. They just want to USE the equipment and
>have fun. Most hams want to PRETEND that they are fairly knowlegeable
>about radio and communications technology. Hey, its a HOBBY!

You may check the results of any DX contest or the Sweepstakes
or go on any transmitter hunt and compete. As Hiram said early
on in the game, the real purpose of amateur radio *IS* to

communicate because "Hey, its a HOBBY!"

Go by Electrospace on Collins Ave up in Richardson, Texas and
look at what is left of the old W5RR research array for 40 meters!
Only four (4) self-supporting 150 foot towers over the space of
longer than a football field with eight (8) three element 40 meter
rotary arrays, two per tower, stacked, all operated in echelon...

Lets see, they made it to 3rd CQWW 40 meter CW only in the
same year I made it to 6th or 7th, I fergit, nationally single
band and all I had was a 4 square on 8-10 mickey soil...
True, you bust up the conductivity when you pave the parking
lot, but heck, research is research, right?

It's a HOBBY, right? Right?

Remembering the musical, Oklahoma,

"What'cha gonna do when he looks that way,
spit'n his eye?"

:)

As to their relative technical skills, I suspect that exactly
the same bell shaped curve exists for the technical skills
of a cell phone user! I'll also bet the relative height of
the skill curve is generally higher in the ham HT user case

than the Cell user case, which was the whole point in
creating the amateur radio portion of the spectrum assignments,
wasn't it? Or was it? :)

>The Hobbyist/Commercial Service Use:
>All sorts of built-in diagnostics that confirm the performance of
>their computers, modems, cell phones, etc. and they understand
>their vendor's ads for new equipment because the focus is on real
>performance and measured improvements, not bells and whistles.

Checked out the specs on the latest DSP Kenwoods, lately,
or for that matter any of the DSP enabled amateur stuff?
The average cell phone user wouldn't even know ANYTHING
about what was published in the text, would they?

50 Hertz passbands at 10 MHZ from cascaded DSP bandpass routines!

Holy whatever!!!! No secret decoder ring Captain Marvel?

You can't play with us, WE have the magic Atomic Ring, the one
that you can take in the closet at night and squint in and see
REAL atomic energy, if the teacher doesn't take it away from you
in school in absolute fear of the radiation... No you CAN'T have it
back Mike, you'll kill us all at show and tell.

Well YOU can't play with US anymore - YOU don't have a ring.

>Hams Use:
>An exclusionary licensing system that tests people with data that
>is rarely used after testing and offers no proof of operating skills.
>They believe that they are smarter and superior to "main-stream" and
>can hide in their "shacks" feeling pretty good about themselves.

The average amateur radio operator is, to my 40 years experience,
is served very well by that data used in testing. The AVERAGE
ham is pretty much in awe of the whole process, quite humble
and profits in many ways from the experience that have nothing
to do with the pure technical data. Same is true for FidoNet and
other BBS sysops. One gets a heck of an education even in what
the way out ends of the personality curve are from anything like this!

Visit 27 Mhz and listen to CB for a while... :)

There is SOMETHING to be said for a SECRET DECODER RING!

>The Hobbyist/Commercial Service Use:
>No licensing to declare yourself an electronic hobbyist and no reason
>to think you aren't equal to all you meet. They ARE "main-stream"
>and are excited that what they can do with their "toys" is growing
>by leaps and bounds. They don't see amateur radio as being the well
>spring of where new toys are coming from. They don't see ads to become
>a ham in their favorite magazines. They don't own a straight key
>and because they work 52 hours per week and are trying to keep a family
>together and happy, they don't see it as the best investment of their

>time.

The declaration of interest is irrelevant as a comparator, when one considers that investing $3000 in a decent computer system is the real declaration, isn't it? Money is, among other things, a tool of creation. The same amount, spent in amatuer radio, is capable of creating opportunities, which to the party that spends it there, is just as important as that spent by the Internaut!

All man's problems have the same sum, don't they? :)

After 40 years on anything much but CW, it must be curious to you that I don't even *OWN* a straight key! I'll gladly take a licking from you in a QSO from whatever you can dish out over 60 WPM on a paddle key any day, but you can't send fast enough with one, nor can any other human I know to do that I have ever met in 40 years.

No, I can't keep up with much over 70 WPM from keyboards or tape keyers or whatever, but if *YOU* want to work at 5 WPM from a straight key, I'll be perfectly happy to do that as well and very happy to make your acquaintence on my turf as well.

In my case, not only do I *NOT* own a straight key, but all of my equipment is controlled by the same computer type equipment that you used to post this and the system operates simultaneously in multiple OS/2 sessions.

1.) Has total operational control of the entire station.
2.) There is a reasonable BBS in another. The BBS is dial-in secured linked to the airway. More and more complex control of it is growing.
3.) There is at least one VHF data link in another.
4.) There is a second VHF (9600 baud!) link in another.
5.) There is a complete dial in GUI interface on another! It can control ALL of the above, right from the desktop!
6.) If we SHOULD meet and you are licensed and in the Callbook, I will know all of that the instant we start talking. Furthermore, you will be announced all over the world, if you are reasonable rare at the moment and your presence will be known world-wide in around five or six seconds from a TelNet connection.

More important, if we ever talk again, or I indicate to the system that I am hearing you (or the SYSTEM hears you in some cases!), all I know about you will be on screen immediatly and there is room here for well over 500000 of you and your friends in my database. You are welcome anytime..

I think? :) <chuckle>

I've used exactly the same equipment you used to post this
to merge your field of interest with mine, and written
much of the code myself, even down to some of the
assembler that was needed.

However, I'm prepared to learn whatever I can from your
adaptation of the technology that is better than mine....

The secret is, per Tom Leher, to plagerize... right? :)

>Hams Use:
>A lot of abbreviations that preclude others from understanding them
>if they are listening to their conversations. Verbal use of the "Q"
>signals, calling "CQ" (Seek You) etc.

I couldn't recognize ACK/NAK if I heard it directly on a modem
line, can you? At what baud rate?

SHhhhhhhhhhhhhh.... no white noise lies in there?

:)

After 40 years, I sort of can recognize RYRYRYRYRYRYRY on
a teletype in my head....

;>

In that same 40 years of sitting doing this, my profile is looking
strangely like the extinct Dodo...

;<

>The Hobbyist/Commercial Service Use:
>Plain language which, although is chock full of acronyms, is used
>by everyone - even school children. They as a consequence feel like
>they are "part of" vs. being "apart from" all others with whom they
>might communicate.

ROTFLM (chucklebox) O. :)

>You get the idea.

I think I understand.... :)

But TTYL about it, I bet after this post. Maybe we can handshake
over it, if we don't get a DCD error when my ZyXel can't negotiate
with your Multicom at a standard 19200 MNP4 protocol.

"I'm so sorry you have reached my answering machine...."

:)

>So my premise is that for amateur radio to really grow and not die,
>it must, as a hobby, have functional communication capabilities that
>are SUPERIOR to what Hobbyist/Commercial Services currently use.

So true, sadly, and right in the middle of a budget crunch in which
the only way we can pay for our government is to auction off
spectrum space.

BTW, heard any good truisms about the modem tax lately?

The Seminoles aren't the only scalped indians down in Florida,
soon, so I hear tel. Pun intended....

>This was the drawing card that started it all and its the one that is
>lacking now. Without it, we are pushing a covered wagon along a freeway
>and the traffic is going to run us over. We can only keep what we have
>if we invest in things better than what we own.
>
>
>73,
>
>John D. Seney
>http://www.mv.com/ipusers/wd1v

Sadly, you are satyrically right, you devil you....

However....

I can't remember the author....

"The optomist fell ten stories..
and after he past each floor..
He yelled out to all his friends below...
all right so far...."

I've had a lot of fun with this one, John, friend WD1V... I hope everyone
takes it as such. Much of what you say is so true, yet so curiously wrong.

I, like many of us, simply do not have the funds to compete with others.

Each issue of the New York Times has more information in it than King Louis
XIV had to work with in his ENTIRE reign as the sun king of France! And
notice, I did NOT capitalize a couple of words... :)

I think Lewis Carroll may have said it best when Alice confronted the
Caterpillar on the mushroom smoking a Hookah. She asked, "Which way
should I go?" He asked, "Where are you going?" She said, "I'm not
sure I know!" To which, I recall, he replied, "Well, then it doesn't
make any difference which direction you take, does it?"

Stop by on 3516 Khz any Sunday night at 0845 CST or Monday 0245GMT
after the NCDX Club re-run of the weekly bulletin for W6TI et. al.

We can let the 4 el phased array fill in the gaps on HF that the routers can't
handle due to melt down....

Yours in faith...

Look at Globe Wireless, they use a special clover called Clover 400. Globe supplies the Clover modem and software. They claim world wide HF coverage on a 24 hour basis. They use existing HF signals to tell which bands are open, your shipboard station keeps a database of usable bands by checking on the continously broadcast HF signals.. I am not sure what the package costs, but look them up.. Generally you will find out more about Globe wireless in most marine magazines

Newsgroups: alt.answers
Summary:
Keywords:

PRINT THIS OUT AND SAVE THIS POSTING ON YOUR COMPUTER,
READ IT OVER A COUPLE OF TIMES,
INVEST,
AND WATCH THE MAIL BOX FOR THE MONEY!

$5, plus the costs of 5 envelopes, 5 peices of paper, 5 stamps and
a couple of hours on a computer and get $50,000
or more back in about six weeks!!!!!!!

Invest in this TOTALY LEGITIMATE oppurtunity,
Remember that this is legal, so you should report the profit of your
investment on your taxes.

Hello, I saw this news group posting and decided to invest $5 into
it and see what I get in return. Hey, what's $5 ? Keep my address and
keep in touch on the amount of money you get. In the posting I saw the
person had done this before and made $47,326 in six weeks with his $5 and
the cost of the stamps to mail the $5 to the five people on the list.
This was his second round. If you do more than the 200 listings you will
make more money.

In this day what does $5 get you, and with all the people on the
internet you are going to get you $5 back in days.

Make $50,000 with a small amount of effort and a small cost of only
$5 and a few hours of computer work (after you have saved this article on
your computer, you can use it to compose your own article, if you want;
just make the neccesary changes, like changing the names below; it should
save you a couple of hours of computer work).

This is a chance for the average person to get ahead in life so
please send out $5 and put a little effort into your postings, and then
watch the money roll in.

This investment will cost you only $5, five stamps, envelopes, paper
and a little computer work. If YOU and EVERY OTHER INVESTOR is HONEST and
follows through with the plan, you will make $50,000 in about six weeks.
Each investor will also make $50,000 in six weeks.
THIS IS A LEGITIMATE INVESTMENT OPORTUNITY !!!!!!!
When the money comes in, make a list of your investors, and you just
started your own ORDER SERVICE COMPANY (don't worry, you don't have to do
anything special, just read this article to the end, and you will get all
the information you need). Since you are starting a company
that provides a service, you make the money LEGITIMATELY (that's the
whole idea about this company business). The service you provide is the
"list of investors" that you have compiled.

You invest $5, and you receive a return on your investment. So does
the next investor. NOT ILLEGAL, NOT A CHAIN LETTER - PERFECTLY LEGITIMATE.

There are other plans like this out there that ask you to send out
$10 to five pepole, thats a fifty dollar investment and its hard to give $50
out when you are struggeling to pay the bills already. But with this
plan you only invest about $5 and others only invest about $5. Hey what's $5
now-a-days? You could probably find that in the cracks of your couch.

If you are not interested, than don't participate, but please print
this article and pass it on to someone who may be interested, so they can
take advantage.

THIS IS WHAT YOU DO:

The procedure is simple:
1) Write your name and address and an e-mail address, on 5 sheets of
paper. Below that, write the words: "Please add me to your list". Then
fold a $1 in each piece of paper (make sure the money is inside the
paper, so that it can't be easily stolen, send no coins) and send them to
the following five addresses:

1. Allen Malkowitch
23 Baker Street #712
Denver CO 80203
USA

2. Wilma Vogel
Broettenstr. 19/25
9020 Klagenfurt
AUSTRIA

3. Lenny LaForget
364 Delisla
Chicoutimi
G76 3B4
CANADA

4. Goran Stojsic
Ljubljanska Avenija 2
236/B

10000 Zagreb
CROATIA

5. Robert Radovic
Ljubljanska Avenija 2
224A/A
10000 Zagreb
CROATIA

2) Now remove the top name from the list, and move the other four names up. In other words, #5 should become #4, and so on. Put your name as the fifth one on the list. Any simple text editor will do.

3) Post the article to at least 200 newsgroups. There are 17,000 of them these days, so it shouldn't be hard to find many. Spend some time on your investment and post to as many newsgroups as you can, and the bigger the newsgroup is, the more people are to see your message and the more money you make. So post to as many as you can.

You are now in an ORDER SERVICES BUSINESS, and should start seeing returns within a week or two. Of course, the more newsgroups you post to, the greater your return is. If you wish to remain anonymous, you may use a psuedonym, call yourself, "The Manager", of "The Boss", whatever, but make sure your address is correct.

HERE IS HOW THE SYSTEM MAKES MONEY:

-Of every 200 posts I made, I received 5 responses. Yes, only five. You make $5 for every 200 posts with your name at #5.

-Each person who sent you $1 now also makes 200 additional postings with your name at #4. i.e. 1000 postings. On average therefore, 50 people will send you $1 with your name at #4. You make $50.

-Your 50 new agents make 200 postings each with your name at #3 or 10,000 postings. Average return= $500. They make 200 postings each with your name at #2= 100,000 postings= 5,000 returns at $1 each= $5,000.

-Finally, 5,000 people make 200 postings each with your name at #1 and you get a return of $50,000 before your name drops off the list. AND THAT'S IF EVERYONE DOWN THE LINE MAKES "ONLY" 200 POSTINGS!

From time to time, when you see your name no longer on the list, you can take the latest posting that appears in the newsgroups, and send out another $5, and put your name at #5, and start posting again. Remember, 200 postings in only a guideline. The more you post, the greater the return.

Let's review why you should do this. THE ONLY COST IS $5. Anyone can afford $5 for such an effortless investment with such SPECTACULAR RETURNS!

You may ask, "what happens if the scheme is played out and no one sends me money?" Big deal, you lose $5. But what are the chances of that

happening? We are talking about the Internet here.

There are millions of Internet users, and thousands more joining everyday! YOU CAN'T LOSE!!! There are too many people out there to not miss this message, and there will be thousands new tomorrow.

Remember, read the instructions CARFULLY, and PLAY FAIRLY. That's the only way this will work. Get a printout so you can refer to this article easily.

REMEMBER-HONESTY IS THE BEST POLICY. YOU DO NOT NEED TO CHEAT THIS IDEA TO MAKE MONEY!! BESIDES, NOT PLAYING THE GAME FAIRLY IS ILLEGAL. SO LET'S BE REASONABLE AND PLAY FAIRLY, SO WE CAN ALL ENJOY THE INTERNET GOLD MINE.

GOOD LUCK!!!! :)

From: gingham2@aol.com (Gingham 2)
Subject: GET FAST CASH

Hello! I've got some awesome news that I think you need to take two minutes to read if you have ever thought "How could I make some serious cash in a hurry???" , or been in serious debt, ready to do almost anything to get the money needed to pay off those bill collectors. So grab a snack, a warm cup of coffee, or a glass of your favorite beverage, get comfortable and listen to this interesting, exciting find!

Let me start by saying that I FINALLY FOUND IT! That's right!. I found it! And I HATE GET RICH QUICK SCHEMES!! I hate those schemes like multi-level marketing, mail-order schemes, envelope stuffing scams, 900 number scams... the list goes on forever. I have tried every darn get rich quick scheme out there over the past 12 years. I somehow got on mailing lists for people looking to make money (more like: 'desperate stupid people who will
try anything for money!'). Well, when I was a teenager, these claims to 'get me rich quick' sounded irresistible! I would shell out $14.95 here, $29.95 there, $24.95 here, and another $49.95 there. I had maxed out my new CircuitCity Card AND my Visa...I was desperate for money!! So, I gave them all a chance but failed at every one of them! Maybe they worked for some people, but not for me. Eventually, I just tossed that JUNK MAIL in the trash when I got the mail. I recognized it right
away. I can smell a money scam from a mile away these days...or so i thought. I believed I could sniff out a scam easily. WAS I WRONG!!...I LOVE THE INTERNET!!!

I was scanning thru a NEWSGROUP and saw an article stating: 'GET CASH FAST'!! I thought..."Here on the Internet?? Well, I'll just have to see what schemes could possibly be on the internet." The article described a way to MAIL A ONE DOLLAR BILL TO ONLY FIVE PEOPLE AND MAKE $50,000 IN CASH IN 4 WEEKS! Well, the more I thought about it, the more I became very curious.
Why? Because of the way it worked AND BECAUSE IT WOULD ONLY COST ME FIVE DOLLARS (AND FIVE STAMPS), THAT'S ALL I EVER PAY....EVER!!

Ok, so the $50,000 in cash was maybe a tough amount to reach, but it was possible. I knew that I could at least get a return of $1,000 or so. So I did it!! As per the instructions in the article, I mailed out ('snail mail'for you e-mail fanatics) a single dollar bill to each of the five people on the list that was contained in the article. I included a small note, with the dollar, that stated "Please Add Me To Your List." I then removed the first position name of the five names listed and moved everyone up one position, and I put my name in position five of the list. This is how the money starts rolling in! I then took this revised article now with my name on the list and REPOSTED IT ON AS MANY NEWSGROUPS AND LOCAL BULLETIN

BOARDMESSAGE AREAS THAT I KNEW. I then waited to watch the money come in...prepared to maybe receive about $1000 to $1500 in cash or so....But what a welcome surprise when those envelopes kept coming in!!! I knew what they were as soon as I saw the return addresses from people all over the world--most from the U.S., but some from Canada, even some from Australia! I tell you, THAT WAS EXCITING!! So how much did I get in total return? $1000? $5000? Not even!!! I received a total of $23,343!!! I couldn't believe it!!

I now have a brand new black Acura Integra to speak for, due to this!! Now after almost 8 months, I am ready to do it again!!! Somaybe it was possible to get $50,000 in cash, I don't know, but IT COMPLETELY DEPENDS ON YOU, THE INDIVIDUAL! You must follow through and repost this article everywhere you can think of!
The more postings you achieve will determine how much cash will arrive in you rvery own mailbox!! It's just too easy to pass up!!!

Let's review the reasons why you should do this: The only cost factors are for the five stamps, 5 envelopes, and the 5 one dollar
bills that you send out to the listed names by snail mail (US Postal Service Mail). Then just simply repost the article (WITH YOUR NAME ADDED) to all the newsgroups and local BBS's you can.
Then sit back, and enjoy walking (you can run if you like! :o) down your driveway to your mailbox and scoop up your rewards!! We all have five dollars to put into such an easy effortless investment with SPECTACULAR REALISTIC RETURNS OF $15,000 to $25,000
in about 3-5weeks! So HOLD OFF ON THOSE LOTTERY NUMBERS FOR TODAY,
EAT AT HOME TONIGHT INSTEAD OF TAKEOUT FROM McDONALDS AND INVEST FIVE
DOLLARS IN THIS AMAZING MONEY MAKING SYSTEM NOW!!! YOU CAN'T LOSE!!

So how do you do it exactly, you ask? I have carefully provided the most detailed, yet straightforward instructions on how to easily
get this underway and get your cash on its way. SO, ARE YOU READY TO
MAKE SOME CASH!!!?? HERE WE GO!!!*** THE LIST OF NAMES IS AT THE END
OF THIS ARTICLE. ***OK, Read this carefully. Get a printout of this
information, if you like, so you can easily refer to it as often as
needed.

INSTRUCTIONS:

1. Take a sheet of paper and write on it the following: "Please add my name
to your list". This creates a service out of this money making system and
thus making it completely legal. You are not just randomly sending a dollar
to someone, you are paying one dollar for a legitimate service. Make sure
you include your name and address. I assure you that, again, this is
completely legal! For a neat little twist, also write what slot their
name was in: "You werein slot 3", Just to add a little fun! This is all
about having fun and making money at the same time!

2. Now fold this sheet of paper around a dollar bill ,(no checks or money
orders), and put them into an envelope and send it on its way to the five
people listed. The folding of the paper around the bill will insure its
arrival to its recipient. THIS STEP IS IMPORTANT!!

3. Now listen carefully, here's where you get YOUR MONEY COMING TO YOUR
MAILBOX. Look at the list of five people; remove the firs tname from
position one and move everyone on the list up slot one on the list.
Position 2 name will now move to the position 1 slot, position 3 will now
become position 2, 4 will be be 3, 5 wil be 4. Now put your name, address,
zipcode AND COUNTRY in position 5, the bottom position on the list.

4. Now upload this updated file to as many newsgroups and local bulletin
boards' message areas & file section as possible. Give a catchy description
of the file so it gets noticed!! Such as: "NEED FAST CASH?, HERE IT IS!,"
or "NEED CASH TO PAY OFF YOUR DEBTS??," etc. And the more uploads, the
more money you will make, and of course, the more money the others on the
list will make too. LET'S ALL TAKE CARE OF EACH OTHER BY BEING HONEST AND
BY PUTTING FORTH 120 PERCENT INTO THIS PROFITABLE & AMAZING SYSTEM!!!
You'll reap the benefits, believe me!!! Set a goal for the number of total
uploads you'll post, such as 15-20 postings or more! Always have a goal
in mind!!! If you can UUE encode the file when uploading, that will make
it easier for the people to receive it and have it downloaded to their hard
drive. That way they get a copy of the article right on their computer
without hassles of viewing and then saving the article from the File menu.
Don't alter the file type, leave it as an MS-DOS Text (***.txt) file.
The best test is to be able to view this file using Microsoft's Notepad for
Windows 3.x or WordPad for Windows '95. If the margins look right without

making the screen slide left or right when at the ends of the sentences, you're in business!

5. If you need help uploading, simply ask the sysop of the BBS, or"POST" a message on a newsgroup asking how to post a file, tell them who your Internet provider is and PEOPLE WILL ALWAYS BE GLAD TO HELP. I would try to describe how to do it but there are simply too many internet software packages with slightly different yet relatively simple ways to post or upload a file. Just ask for help or look in the help section for 'posting'.
I do know that for GNN, you simply select 'POST' then enter a catchy description under the subject box, choose 'ATTACH', selecting 'UUE' and NOT 'TXT', then choose 'Browse' to go look for the file. Find your text file CASH.TXT and click on it and choose 'OK'. Place a one line statement
in the main body section of the message post screen. Something like "Download this to read how to get cash arriving in your mailbox with no paybacks!," or whatever. Just make sure it represents its true feasibility,
NOT something like:" Get one million dollars flooding in your mailbox in two days!" You'll never get ANY responses!

6. And this is the step I like. JUST SIT BACK AND ENJOY LIFE BECAUSE CASH
IS ON THE WAY!! Expect to see a little money start to trickle in around 2 weeks, but AT ABOUT WEEKS 3 & 4, THE MONEY STORM WILL HIT YOUR MAILBOX!! All you have to do is take it out of the mailbox and try not to scream too
loud (outside anyway) when you realize YOU HIT THE BIG TIME AT LAST!!

7. So go PAY OFF YOUR BILLS AND DEBTS and then get that something special
you always wanted or buy that special person in your life (or the one you want in your life :)) a gift they'll never forget. ENJOY LIFE!

8. Now when you get low on this money supply, simply re-activate this file again; Reposting it in the old places where you originally posted and
possibly some new places you now know of. Don't ever lose this file, always
keep a copy at your reach for when you ever need cash. THIS IS AN INCREDIBLE TOOL THAT YOU CAN ALWAYS RE-USE TIME AND TIME AGAIN WHEN CASH IS NEEDED!

9. (This comment added by Ron Markarian) Hell dude, this is great, just send the money and wait like 1 week, then all of a sudden, BOOOOOOM! Mail flood FULL of dollar bills. Hahahaha...its great

WOW! Can you imagine the monthly birdy bill from INMARSAT on a PERMANENT marine connection? Hmm...let's see...$10/minute X 60 X 24 X 31 X 12. Billy Gates could have this.

>1) Is it possible to get satellite downstream and packet radio
>upstream, worldwide?

If you are thinking about packet radio on HF, you are looking at perhaps 300 baud maximum. HF radio is VERY noisy. Computer parts HATE noise, as I'm sure you know. I am a ham radio operator. We have been using packet radio on HF for many years. FCC limits us to 300 baud because HF is very crowded and they INSIST that we stay to the bandwidth of ONE SSB voice channel (about 3Khz). Good luck.

>2) If not, which speeds are possible over duplex packet radio?

300 baud on HF, 1200-2400 baud on VHF.

>3) Are there any world wide packet radio ISPs, or do you have to hop
>from one to the next?

Internet on long range HF radio would never happen. Connect to your ISP, if he'll let you, at 300 baud. This would be ideal HF conditions, no noise. Your favorite home page MIGHT download in a day. No way, Jose.

>4) Or would private radio hobbyists forward your traffic to your ISP?

Ham radio operators have a worldwide packet radio BBS system that can be accessed from ANY boat equipped with a licensed ham radio operator and an HF ham radio station. There are several frequencies on the different HF ham bands that allow user access via HF. Many systems are used STRICTLY for mail forwarding. This system is the very simplest of bbs email and is only connected to other ham radio stations, not the internet. Internet's HUGE load of data would swamp the HF system to make it totally useless.

As another note, Bob Bruninga WB4APR at the US Naval Academy, has invented a fantastic packet radio GPS reporting system in use by Navy ships and ham radio operators worldwide. A special GPS compatible firmware is installed in the boat mounted packet modem (They are only $100) which transmits the GPS data to anyone who can monitor them with Bob's program (APRS, it's called). The program, and packet radio, work great on HF and VHF radio. I can track the Naval Academy's sailing vessels and other craft from here in Charleston, SC almost anytime. The program displays ship speed, position, type, name, direction of travel and is capable of keyboard to keyboard

communications between stations. It also has an amazingly good
broadcasting function which allows any station using the PC program to
enter system-wide announcements and bulletins to all stations. The
receiving stations' programs have special windows where these are
stored and displayed. Now, wouldn't this be a neat way of reading
NOTAMs?

It's a pity APRS has not been implemented by the government
bureaucracy for the safety aspect of having an aircraft type beacon
system in the marine environment. Any station not reporting in every
X minutes automatically could trigger an alarm. Emergency
communcations is already built into the system. Shame it's not on
YOUR boat.

Those who will even admit that there are better methods tend to say
that. Though "I think I heard an 'M', or was that just the furnace
kicking on?" doesn't seem like much of a contact to me, I suppose
some people enjoy it. I don't begrudge them that enjoyment. But
I know one fellow personally who spends months getting ready for one
of the "tests". Somehow I think he enjoys the planning and station
engineering more than the actual event (he certainly talks about it
more), and I suspect that if he felt comfortable with digital technique
he'd enjoy planning and setting that up too (and would crank the power
down or prune back the antennas to bring the RF engineering challenge
back). But if listening to noise gets the weak signal crowd off, then
adding a little SS noise should make it just that much spicier for them.
It'd add to the challenge, and hence the "fun". If they had real messages
to convey, or if they were *really* serious about working weak signals,
they'd adopt the better methods.

Note, I generally admire the weak signal crowd for their RF engineering
expertise. It just seems a pity to waste all that talent on such a poor

signaling method.

>: is clear. In essence it is a NIMBY response. Spectrum studies have

>
>Wow! Could you cite a reference to this study? Seriously, I'd like to
>see it and how the authors define things like 'occupancy' and
>'heavily used'.

That figure came from Lyle Johnson's talk at DCC, and was an upper bound. It's fairly easily confirmed, all you need do is monitor for 24 hours with a spectrum analyzer from a good site. The amount of vacant spectrum is astounding for a band which is supposedly "full". A full band would have every Hertz fully utilized all the time. Even with the inefficient modulations in use, that's not even close to true. Not even at peak usage times.

>: to accomodate growth. No wonder others are eying our bands, they are
>: at least four fifths underutilized when viewed by those willing to
>
>I know the VHF+ bands are being eyed, but was unaware that HF is being
>coveted by other services. Could you tell me who they are?

Well, of course I was addressing the VHF+ spectrum, since that's what the current SS rulemaking is about. But if you want a threat to HF, I already mentioned "compatible digital" broadcast (which really isn't compatible with anything but the broadcaster's own signal). Field tests have already been conducted for the FCC by a consortium of broadcasters and equipment manufacturers (last winter in Cincinnati). The immediate target is to get the system deployed on the Standard Broadcast band because FM is eating their lunch, but there's considerable interest among SW broadcast operators as well.

Both the industry and the government acknowledge that the planned move of SW broadcast to SSB is a dead issue. CD is the road that offers them a way to remain competitive with the soon to be deployed satellite DAB systems, but they'll need more exclusive spectrum to pull it off. This is almost certain to be raised at WRC99 if it doesn't sneak into WRC97.

Also, I know of a contract a manufacturer has with a major long haul trucking company to develop a HF truck tracking system that's cheaper than the LEO system proposed by those guys after 2m and 70cm (cheaper because *there's no recurring usage charge* since the ionosphere is free). That'll need spectrum spaced so that the MUF can be followed for a number of medium and short hop paths in the US. It'll use ALE techniques for sure. My source didn't say if it'll also be SS, or whether it'll use narrowband packet techniques (I suspect the latter since the company has expertise in that area). In either case, it'll need several spectrum slices, probably below 15 MHz.

This one use probably won't impact the amateur allocations at HF directly, but if it starts a trend among those with cost sensitive applications which need low rate data over medium to long distances, well there goes the neighborhood.

Gary

PRINT THIS OUT AND SAVE THIS POSTING ON YOUR COMPUTER,
READ IT OVER A COUPLE OF TIMES,
INVEST,
AND WATCH THE MAIL BOX FOR THE MONEY!

$5, plus the costs of 5 envelopes, 5 peices of paper, 5 stamps and
a couple of hours on a computer and get $50,000
or more back in about six weeks!!!!!!!

Invest in this TOTALY LEGITIMATE oppurtunity,
Remember that this is legal, so you should report the profit of your
investment on your taxes.

Hello, I saw this news group posting and decided to invest $5 into
it and see what I get in return. Hey, what's $5 ? Keep my address and
keep in touch on the amount of money you get. In the posting I saw the
person had done this before and made $47,326 in six weeks with his $5 and
the cost of the stamps to mail the $5 to the five people on the list.
This was his second round. If you do more than the 200 listings you will
make more money.

In this day what does $5 get you, and with all the people on the
internet you are going to get you $5 back in days.

Make $50,000 with a small amount of effort and a small cost of only
$5 and a few hours of computer work (after you have saved this article on
your computer, you can use it to compose your own article, if you want;
just make the neccesary changes, like changing the names below; it should
save you a couple of hours of computer work).

This is a chance for the average person to get ahead in life so
please send out $5 and put a little effort into your postings, and then
watch the money roll in.

This investment will cost you only $5, five stamps, envelopes, paper
and a little computer work. If YOU and EVERY OTHER INVESTOR is HONEST and
follows through with the plan, you will make $50,000 in about six weeks.
Each investor will also make $50,000 in six weeks.
THIS IS A LEGITIMATE INVESTMENT OPORTUNITY !!!!!!!
When the money comes in, make a list of your investors, and you just
started your own ORDER SERVICE COMPANY (don't worry, you don't have to do
anything special, just read this article to the end, and you will get all
the information you need). Since you are starting a company
that provides a service, you make the money LEGITIMATELY (that's the
whole idea about this company business). The service you provide is the
"list of investors" that you have compiled.

You invest $5, and you receive a return on your investment. So does
the next investor. NOT ILLEGAL, NOT A CHAIN LETTER - PERFECTLY LEGITIMATE.

There are other plans like this out there that ask you to send out
$10 to five pepole, thats a fifty dollar investment and its hard to give $50
out when you are struggeling to pay the bills already. But with this
plan you only invest about $5 and others only invest about $5. Hey what's $5
now-a-days? You could probably find that in the cracks of your couch.

If you are not interested, than don't participate, but please print
this article and pass it on to someone who may be interested, so they can
take advantage.

THIS IS WHAT YOU DO:

The procedure is simple:
1) Write your name and address and an e-mail address, on 5 sheets of
paper. Below that, write the words: "Please add me to your list". Then
fold a $1 in each piece of paper (make sure the money is inside the
paper, so that it can't be easily stolen, send no coins) and send them to
the following five addresses:

1. Allen Malkowitch
23 Baker Street #712
Denver CO 80203
USA

2. Wilma Vogel
Broettenstr. 19/25
9020 Klagenfurt
AUSTRIA

3. Lenny LaForget
364 Delisla
Chicoutimi
G76 3B4
CANADA

4. Goran Stojsic
Ljubljanska Avenija 2
236/B

10000 Zagreb
CROATIA

5. Robert Radovic
Ljubljanska Avenija 2
224A/A
10000 Zagreb
CROATIA

2) Now remove the top name from the list, and move the other four names up. In other words, #5 should become #4, and so on. Put your name as the fifth one on the list. Any simple text editor will do.

3) Post the article to at least 200 newsgroups. There are 17,000 of them these days, so it shouldn't be hard to find many. Spend some time on your investment and post to as many newsgroups as you can, and the bigger the newsgroup is, the more people are to see your message and the more money you make. So post to as many as you can.

You are now in an ORDER SERVICES BUSINESS, and should start seeing returns within a week or two. Of course, the more newsgroups you post to, the greater your return is. If you wish to remain anonymous, you may use a psuedonym, call yourself, "The Manager", of "The Boss", whatever, but make sure your address is correct.

HERE IS HOW THE SYSTEM MAKES MONEY:

-Of every 200 posts I made, I received 5 responses. Yes, only five. You make $5 for every 200 posts with your name at #5.

-Each person who sent you $1 now also makes 200 additional postings with your name at #4. i.e. 1000 postings. On average therefore, 50 people will send you $1 with your name at #4. You make $50.

-Your 50 new agents make 200 postings each with your name at #3 or 10,000 postings. Average return= $500. They make 200 postings each with your name at #2= 100,000 postings= 5,000 returns at $1 each= $5,000.

-Finally, 5,000 people make 200 postings each with your name at #1 and you get a return of $50,000 before your name drops off the list. AND THAT'S IF EVERYONE DOWN THE LINE MAKES "ONLY" 200 POSTINGS!

From time to time, when you see your name no longer on the list, you can take the latest posting that appears in the newsgroups, and send out another $5, and put your name at #5, and start posting again. Remember, 200 postings in only a guideline. The more you post, the greater the return.

Let's review why you should do this. THE ONLY COST IS $5. Anyone can afford $5 for such an effortless investment with such SPECTACULAR RETURNS!

You may ask, "what happens if the scheme is played out and no one sends me money?" Big deal, you lose $5. But what are the chances of that

happening? We are talking about the Internet here.

There are millions of Internet users, and thousands more joining everyday! YOU CAN'T LOSE!!! There are too many people out there to not miss this message, and there will be thousands new tomorrow.

Remember, read the instructions CARFULLY, and PLAY FAIRLY. That's the only way this will work. Get a printout so you can refer to this article easily.

REMEMBER-HONESTY IS THE BEST POLICY. YOU DO NOT NEED TO CHEAT THIS IDEA TO MAKE MONEY!! BESIDES, NOT PLAYING THE GAME FAIRLY IS ILLEGAL. SO LET'S BE REASONABLE AND PLAY FAIRLY, SO WE CAN ALL ENJOY THE INTERNET GOLD MINE.

GOOD LUCK!!!! :)

From: gingham2@aol.com (Gingham 2)
Subject: GET FAST CASH

Hello! I've got some awesome news that I think you need to take two minutes to read if you have ever thought "How could I make some serious cash in a hurry???" , or been in serious debt, ready to do almost anything to get the money needed to pay off those bill collectors. So grab a snack, a warm cup of coffee, or a glass of your favorite beverage, get comfortable and listen to this interesting, exciting find!

Let me start by saying that I FINALLY FOUND IT! That's right!. I found it! And I HATE GET RICH QUICK SCHEMES!! I hate those schemes like multi-level marketing, mail-order schemes, envelope stuffing scams, 900 number scams... the list goes on forever. I have tried every darn get rich quick scheme out there over the past 12 years. I somehow got on mailing lists for people looking to make money (more like: 'desperate stupid people who will
try anything for money!'). Well, when I was a teenager, these claims to 'get me rich quick' sounded irresistible! I would shell out $14.95 here, $29.95 there, $24.95 here, and another $49.95 there. I had maxed out my new CircuitCity Card AND my Visa...I was desperate for money!! So, I gave them all a chance but failed at every one of them! Maybe they worked for some people, but not for me. Eventually, I just tossed that JUNK MAIL in the trash when I got the mail. I recognized it right
away. I can smell a money scam from a mile away these days...or so i thought. I believed I could sniff out a scam easily. WAS I WRONG!!...I LOVE THE INTERNET!!!

I was scanning thru a NEWSGROUP and saw an article stating: 'GET CASH FAST'!! I thought..."Here on the Internet?? Well, I'll just have to see what schemes could possibly be on the internet." The article described a way to MAIL A ONE DOLLAR BILL TO ONLY FIVE PEOPLE AND MAKE $50,000 IN CASH IN 4 WEEKS! Well, the more I thought about it, the more I became very curious.
Why? Because of the way it worked AND BECAUSE IT WOULD ONLY COST ME FIVE DOLLARS (AND FIVE STAMPS), THAT'S ALL I EVER PAY....EVER!!

Ok, so the $50,000 in cash was maybe a tough amount to reach, but it was possible. I knew that I could at least get a return of $1,000 or so. So I did it!! As per the instructions in the article, I mailed out ('snail mail'for you e-mail fanatics) a single dollar bill to each of the five people on the list that was contained in the article. I included a small note, with the dollar, that stated "Please Add Me To Your List." I then removed the first position name of the five names listed and moved everyone up one position, and I put my name in position five of the list. This is how the money starts rolling in! I then took this revised article now with my name on the list and REPOSTED IT ON AS MANY NEWSGROUPS AND LOCAL BULLETIN

BOARDMESSAGE AREAS THAT I KNEW. I then waited to watch the money come in...prepared to maybe receive about $1000 to $1500 in cash or so....But what a welcome surprise when those envelopes kept coming in!!! I knew what they were as soon as I saw the return addresses from people all over the world--most from the U.S., but some from Canada, even some from Australia! I tell you, THAT WAS EXCITING!! So how much did I get in total return? $1000? $5000? Not even!!! I received a total of $23,343!!! I couldn't believe it!!

I now have a brand new black Acura Integra to speak for, due to this!! Now after almost 8 months, I am ready to do it again!!! Somaybe it was possible to get $50,000 in cash, I don't know, but IT COMPLETELY DEPENDS ON YOU, THE INDIVIDUAL! You must follow through and repost this article everywhere you can think of!
The more postings you achieve will determine how much cash will arrive in you rvery own mailbox!! It's just too easy to pass up!!!

Let's review the reasons why you should do this: The only cost factors are for the five stamps, 5 envelopes, and the 5 one dollar
bills that you send out to the listed names by snail mail (US Postal Service Mail). Then just simply repost the article (WITH YOUR NAME ADDED) to all the newsgroups and local BBS's you can.
Then sit back, and enjoy walking (you can run if you like! :o) down your driveway to your mailbox and scoop up your rewards!! We all have five dollars to put into such an easy effortless investment with SPECTACULAR REALISTIC RETURNS OF $15,000 to $25,000
in about 3-5weeks! So HOLD OFF ON THOSE LOTTERY NUMBERS FOR TODAY,
EAT AT HOME TONIGHT INSTEAD OF TAKEOUT FROM McDONALDS AND INVEST FIVE
DOLLARS IN THIS AMAZING MONEY MAKING SYSTEM NOW!!! YOU CAN'T LOSE!!

So how do you do it exactly, you ask? I have carefully provided the most detailed, yet straightforward instructions on how to easily
get this underway and get your cash on its way. SO, ARE YOU READY TO
MAKE SOME CASH!!!?? HERE WE GO!!!*** THE LIST OF NAMES IS AT THE END
OF THIS ARTICLE. ***OK, Read this carefully. Get a printout of this
information, if you like, so you can easily refer to it as often as
needed.

INSTRUCTIONS:

1. Take a sheet of paper and write on it the following: "Please add my name
to your list". This creates a service out of this money making system and
thus making it completely legal. You are not just randomly sending a dollar
to someone, you are paying one dollar for a legitimate service. Make sure
you include your name and address. I assure you that, again, this is
completely legal! For a neat little twist, also write what slot their
name was in: "You werein slot 3", Just to add a little fun! This is all
about having fun and making money at the same time!

2. Now fold this sheet of paper around a dollar bill ,(no checks or money
orders), and put them into an envelope and send it on its way to the five
people listed. The folding of the paper around the bill will insure its
arrival to its recipient. THIS STEP IS IMPORTANT!!

3. Now listen carefully, here's where you get YOUR MONEY COMING TO YOUR
MAILBOX. Look at the list of five people; remove the firs tname from
position one and move everyone on the list up slot one on the list.
Position 2 name will now move to the position 1 slot, position 3 will now
become position 2, 4 will be be 3, 5 wil be 4. Now put your name, address,
zipcode AND COUNTRY in position 5, the bottom position on the list.

4. Now upload this updated file to as many newsgroups and local bulletin
boards' message areas & file section as possible. Give a catchy description
of the file so it gets noticed!! Such as: "NEED FAST CASH?, HERE IT IS!,"
or "NEED CASH TO PAY OFF YOUR DEBTS??," etc. And the more uploads, the
more money you will make, and of course, the more money the others on the
list will make too. LET'S ALL TAKE CARE OF EACH OTHER BY BEING HONEST AND
BY PUTTING FORTH 120 PERCENT INTO THIS PROFITABLE & AMAZING SYSTEM!!!
You'll reap the benefits, believe me!!! Set a goal for the number of total
uploads you'll post, such as 15-20 postings or more! Always have a goal
in mind!!! If you can UUE encode the file when uploading, that will make
it easier for the people to receive it and have it downloaded to their hard
drive. That way they get a copy of the article right on their computer
without hassles of viewing and then saving the article from the File menu.
Don't alter the file type, leave it as an MS-DOS Text (***.txt) file.
The best test is to be able to view this file using Microsoft's Notepad for
Windows 3.x or WordPad for Windows '95. If the margins look right without

making the screen slide left or right when at the ends of the sentences, you're in business!

5. If you need help uploading, simply ask the sysop of the BBS, or"POST" a message on a newsgroup asking how to post a file, tell them who your Internet provider is and PEOPLE WILL ALWAYS BE GLAD TO HELP. I would try to describe how to do it but there are simply too many internet software packages with slightly different yet relatively simple ways to post or upload a file. Just ask for help or look in the help section for 'posting'.
I do know that for GNN, you simply select 'POST' then enter a catchy description under the subject box, choose 'ATTACH', selecting 'UUE' and NOT 'TXT', then choose 'Browse' to go look for the file. Find your text file CASH.TXT and click on it and choose 'OK'. Place a one line statement
in the main body section of the message post screen. Something like "Download this to read how to get cash arriving in your mailbox with no paybacks!," or whatever. Just make sure it represents its true feasibility,
NOT something like:" Get one million dollars flooding in your mailbox in two days!" You'll never get ANY responses!

6. And this is the step I like. JUST SIT BACK AND ENJOY LIFE BECAUSE CASH
IS ON THE WAY!! Expect to see a little money start to trickle in around 2 weeks, but AT ABOUT WEEKS 3 & 4, THE MONEY STORM WILL HIT YOUR MAILBOX!! All you have to do is take it out of the mailbox and try not to scream too
loud (outside anyway) when you realize YOU HIT THE BIG TIME AT LAST!!

7. So go PAY OFF YOUR BILLS AND DEBTS and then get that something special
you always wanted or buy that special person in your life (or the one you want in your life :)) a gift they'll never forget. ENJOY LIFE!

8. Now when you get low on this money supply, simply re-activate this file again; Reposting it in the old places where you originally posted and
possibly some new places you now know of. Don't ever lose this file, always
keep a copy at your reach for when you ever need cash. THIS IS AN INCREDIBLE TOOL THAT YOU CAN ALWAYS RE-USE TIME AND TIME AGAIN WHEN CASH IS NEEDED!

9. (This comment added by Ron Markarian) Hell dude, this is great, just send the money and wait like 1 week, then all of a sudden, BOOOOOOM! Mail flood FULL of dollar bills. Hahahaha...its great

WOW! Can you imagine the monthly birdy bill from INMARSAT on a PERMANENT marine connection? Hmm...let's see...$10/minute X 60 X 24 X 31 X 12. Billy Gates could have this.

>1) Is it possible to get satellite downstream and packet radio
>upstream, worldwide?

If you are thinking about packet radio on HF, you are looking at perhaps 300 baud maximum. HF radio is VERY noisy. Computer parts HATE noise, as I'm sure you know. I am a ham radio operator. We have been using packet radio on HF for many years. FCC limits us to 300 baud because HF is very crowded and they INSIST that we stay to the bandwidth of ONE SSB voice channel (about 3Khz). Good luck.

>2) If not, which speeds are possible over duplex packet radio?

300 baud on HF, 1200-2400 baud on VHF.

>3) Are there any world wide packet radio ISPs, or do you have to hop
>from one to the next?

Internet on long range HF radio would never happen. Connect to your ISP, if he'll let you, at 300 baud. This would be ideal HF conditions, no noise. Your favorite home page MIGHT download in a day. No way, Jose.

>4) Or would private radio hobbyists forward your traffic to your ISP?

Ham radio operators have a worldwide packet radio BBS system that can be accessed from ANY boat equipped with a licensed ham radio operator and an HF ham radio station. There are several frequencies on the different HF ham bands that allow user access via HF. Many systems are used STRICTLY for mail forwarding. This system is the very simplest of bbs email and is only connected to other ham radio stations, not the internet. Internet's HUGE load of data would swamp the HF system to make it totally useless.

As another note, Bob Bruninga WB4APR at the US Naval Academy, has invented a fantastic packet radio GPS reporting system in use by Navy ships and ham radio operators worldwide. A special GPS compatible firmware is installed in the boat mounted packet modem (They are only $100) which transmits the GPS data to anyone who can monitor them with Bob's program (APRS, it's called). The program, and packet radio, work great on HF and VHF radio. I can track the Naval Academy's sailing vessels and other craft from here in Charleston, SC almost anytime. The program displays ship speed, position, type, name, direction of travel and is capable of keyboard to keyboard

communications between stations. It also has an amazingly good
broadcasting function which allows any station using the PC program to
enter system-wide announcements and bulletins to all stations. The
receiving stations' programs have special windows where these are
stored and displayed. Now, wouldn't this be a neat way of reading
NOTAMs?

It's a pity APRS has not been implemented by the government
bureaucracy for the safety aspect of having an aircraft type beacon
system in the marine environment. Any station not reporting in every
X minutes automatically could trigger an alarm. Emergency
communcations is already built into the system. Shame it's not on
YOUR boat.

Those who will even admit that there are better methods tend to say
that. Though "I think I heard an 'M', or was that just the furnace
kicking on?" doesn't seem like much of a contact to me, I suppose
some people enjoy it. I don't begrudge them that enjoyment. But
I know one fellow personally who spends months getting ready for one
of the "tests". Somehow I think he enjoys the planning and station
engineering more than the actual event (he certainly talks about it
more), and I suspect that if he felt comfortable with digital technique
he'd enjoy planning and setting that up too (and would crank the power
down or prune back the antennas to bring the RF engineering challenge
back). But if listening to noise gets the weak signal crowd off, then
adding a little SS noise should make it just that much spicier for them.
It'd add to the challenge, and hence the "fun". If they had real messages
to convey, or if they were *really* serious about working weak signals,
they'd adopt the better methods.

Note, I generally admire the weak signal crowd for their RF engineering
expertise. It just seems a pity to waste all that talent on such a poor

signaling method.

>: is clear. In essence it is a NIMBY response. Spectrum studies have

>
>Wow! Could you cite a reference to this study? Seriously, I'd like to
>see it and how the authors define things like 'occupancy' and
>'heavily used'.

That figure came from Lyle Johnson's talk at DCC, and was an upper bound. It's fairly easily confirmed, all you need do is monitor for 24 hours with a spectrum analyzer from a good site. The amount of vacant spectrum is astounding for a band which is supposedly "full". A full band would have every Hertz fully utilized all the time. Even with the inefficient modulations in use, that's not even close to true. Not even at peak usage times.

>: to accomodate growth. No wonder others are eying our bands, they are
>: at least four fifths underutilized when viewed by those willing to
>
>I know the VHF+ bands are being eyed, but was unaware that HF is being
>coveted by other services. Could you tell me who they are?

Well, of course I was addressing the VHF+ spectrum, since that's what the current SS rulemaking is about. But if you want a threat to HF, I already mentioned "compatible digital" broadcast (which really isn't compatible with anything but the broadcaster's own signal). Field tests have already been conducted for the FCC by a consortium of broadcasters and equipment manufacturers (last winter in Cincinnati). The immediate target is to get the system deployed on the Standard Broadcast band because FM is eating their lunch, but there's considerable interest among SW broadcast operators as well.

Both the industry and the government acknowledge that the planned move of SW broadcast to SSB is a dead issue. CD is the road that offers them a way to remain competitive with the soon to be deployed satellite DAB systems, but they'll need more exclusive spectrum to pull it off. This is almost certain to be raised at WRC99 if it doesn't sneak into WRC97.

Also, I know of a contract a manufacturer has with a major long haul trucking company to develop a HF truck tracking system that's cheaper than the LEO system proposed by those guys after 2m and 70cm (cheaper because *there's no recurring usage charge* since the ionosphere is free). That'll need spectrum spaced so that the MUF can be followed for a number of medium and short hop paths in the US. It'll use ALE techniques for sure. My source didn't say if it'll also be SS, or whether it'll use narrowband packet techniques (I suspect the latter since the company has expertise in that area). In either case, it'll need several spectrum slices, probably below 15 MHz.

This one use probably won't impact the amateur allocations at HF directly, but if it starts a trend among those with cost sensitive applications which need low rate data over medium to long distances, well there goes the neighborhood.

Gary

Another option, although somewhat (read: way the hell too much) expensive is a
satellite phone. I know that a lot of larger yachts have global satellite
phones so that you can be reached at a single number anywhere in the world.
Sorta like cellular only the next step up. Well, not really... the technology
is different but the idea is the same. I believe though that rates are in the
5 dollars per minute and up range. This in addition to a rather hefty
equipment cost. If money is not a problem for you though, I would go this
route.

The phone is a technically feasable but as you say - expensive! I was
talking to to someone from our shipping affiliate (we operate tankers)
that was discussing offshore data needs.

He said they are going with satelite but they are going to use a system that does maintain a constant connection (Inmarsat conections will eat money real fast). The problem with the phone type connection is you will pay as long as the connection is up - even if you aren't sending or receiving data. They system that our tankers will be using will packet the data and "burst it" in and out of a buffer at high speed.

I'll see if I can locate anyone upstairs that knows more about it.

>Not even at peak usage times.

Another aspect of usage that is ignored goes beyond the peak usage
times and that is the fact that peak usage for hams is generally at
times when other services are not in their peak usage periods.
Additionally, if you look at usage for 24 hour by 7 days a week, then
you see ham usage is really low.

From what I've heard from people, the complaint or fear of having
an influx (too many) hams on HF is really based on the fact that
such an influx, if it happens, would detract (over crowd) the typical
ham operating periods (peak usage times) which are weekends
and evenings. Such fears, even if realized, still ignor the fact
that the ham bands have a very low usage when measured
over the 24 hour by 7 day a week total time frame.

Ok, does that mean that I can get a world-wide 2400 baud telnet
connection? That would be ideal.

> Internet on long range HF radio would never happen. Connect to your
> ISP, if he'll let you, at 300 baud.

Well, for sending and receiving email that's good enough.
Anyone knows an ISP which would let me do this?

Axel

If you've got access to the phone lines _via_ whatever why not use a
Linux box at the house as a PPP server to dial-in to and let it connect
to the ISP? That way the ISP is not involved.

5695. Hams Need to Develop Better Technology

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-10-31 00:00:00 UTC
From: john@wd1v.mv.com
Message-ID: <john-3110960819120001@wd1v.mv.com>
Source record: 33841

In the last 40 years, hams have lost more than frequency. They have lost functional communications performance and the once cherished uniqueness of what only amateur wireless services could provide.

Today, the contrast is such that someone that selects amateur radio as a hobby is picking inferior communications performance and capability that is so far behind the times its like a student picking a Commodore C64 or VIC-20 while his classmates are selecting Pentiums.

Consider some of the spikes of the spectrum of contrasts:

Hams Use:
Packet Radio - with 1200 baud TNCs so their ASCII text files can snarl their network and their TCP/IP portion moves binary data at the same speed. The traffic that moves at 9600 baud is precious little.

The Hobbyist/Commercial Service Use:
Internet - with typical 28,800 baud modems so their files fly. Some users are doing "verbal email" and many expect faster modems that will soon support video and audio teleconferencing. More and more people are signing up for wireless Internet. They are paying $20.00 per month. Less than the cost/month of what most hams spend for a HF rig.

Hams Use:
2 meter FM so they can communicate from their cars with others in their cars or homes. There is a suggestion that with "autopatch" this network of "skilled radio operators" is poised to help folks when other forms of communications fail or simply aren't available. The facts are that there are no national standards for communicating emergency traffic via 2 meter FM. If you are having a coronary and need assistance and 2 folks show up to help, one with a 2 meter HT and the other with a cellular phone, guess who is going to get help to you the fastest?

The Hobbyist/Commercial Service Use:
Cellular phones - with more and more phones looking like HTs in that they are portable and can be held in a shirt pocket or purse and are battery operated.

Hams Use:
HF radios to communicate with others for either random contacts or to reach a specific goal - such as working all states, testing a radio or antenna, scoring points in a contest, or meeting specific people (schedules) or meeting random people with specific interests (nets). The theoretical value of HF is that distances can be covered that VHF can't accomplish thanks to the well characterized miracle

of skip propagation.

The Hobbyist/Commercial Service Use:
Internet with a WAN perspective where satellites and fiber optics
negate propagation phenomona to anywhere on the globe.

Hams Use:
Orbiting satellites that takes thousands of dollars to use.

The Hobbyist/Commercial Service Use:
DDS TV geostationary satellites that cost less than $300 to use.
2 way communications are coming to these channels.

Hams Use:
Their own judgement about on the air performance so the performance
of their station is largely subjective. They have no universally
understood scorecard and none of their equipment has built-in
diagnostics that determine the station's metric performance. Most
hams don't own instruments that let them accurately measure much
of anything. Most hams don't build. Most hams can't build. Most
hams don't want to build. They just want to USE the equipment and
have fun. Most hams want to PRETEND that they are fairly knowlegeable
about radio and communications technology. Hey, its a HOBBY!

The Hobbyist/Commercial Service Use:
All sorts of built-in diagnostics that confirm the performance of
their computers, modems, cell phones, etc. and they understand
their vendor's ads for new equipment because the focus is on real
performance and measured improvements, not bells and whistles.

Hams Use:
An exclusionary licensing system that tests people with data that
is rarely used after testing and offers no proof of operating skills.
They believe that they are smarter and superior to "main-stream" and
can hide in their "shacks" feeling pretty good about themselves.

The Hobbyist/Commercial Service Use:
No licensing to declare yourself an electronic hobbyist and no reason
to think you aren't equal to all you meet. They ARE "main-stream"
and are excited that what they can do with their "toys" is growing
by leaps and bounds. They don't see amateur radio as being the well
spring of where new toys are coming from. They don't see ads to become
a ham in their favorite magazines. They don't own a straight key
and because they work 52 hours per week and are trying to keep a family
together and happy, they don't see it as the best investment of their
time.

Hams Use:
A lot of abbreviations that preclude others from understanding them
if they are listening to their conversations. Verbal use of the "Q"
signals, calling "CQ" (Seek You) etc.

The Hobbyist/Commercial Service Use:
Plain language which, although is chock full of acronyms, is used by everyone - even school children. They as a consequence feel like they are "part of" vs. being "apart from" all others with whom they might communicate.

You get the idea.

So my premise is that for amateur radio to really grow and not die, it must, as a hobby, have functional communication capabilities that are SUPERIOR to what Hobbyist/Commercial Services currently use.

This was the drawing card that started it all and its the one that is lacking now. Without it, we are pushing a covered wagon along a freeway and the traffic is going to run us over. We can only keep what we have if we invest in things better than what we own.

73,

John D. Seney

>ago.

Last I knew, the company was still around doing commercial projects for
clients.

The principles Ron and Mike, both hams, got so disgusted with the way
hams around the world willingly ripped them off that they vowed to never
write code for hams again ... our loss, Ron and Mike were very creative
and talented guys ...

BTW ... TheNet WAS a theft by the Germans, a reverse compile of the
NetRom code from a NetRom ROM sent to them by WA8DED ... I personally
saw the sources and the comparison was totally identical ... not a
shred of doubt about it ...

Also, I don't think they threatened to sue all hams ... just the Germans
who stole the code and some blatant jerk American hams who insisted on
distributing it and promoting it saying "Why should be pay for NetRom
.. all ham software should be free."

It was a disgrace to all of ham radio ...

THIS IS THE FAIREST MOST HONEST WAY I KNOW TO

SHARE THE WEALTH! Hi there!

Question: would you like to make thousands of dollars,

quick, legally, with NO CATCH? If Yes, then keep reading. Please

take five minutes to read this article. It will change your life, just

like it did mine. If you're not interested, I apologize for wasting your

time.

It's true! You can make up to or over $50,000 dollars in 4-6

weeks, maybe sooner! I SWEAR I'M NOT LYING TO YOU, AND

THIS IS NOT A SCAM! Interested? Then here we go.

A little while back, I was browsing through these

newsgroups, just like you are now, and came across an article

similar to this one, which said; "You could make thousands of

dollars in weeks with an initial investment of only $5!" So, I thought,

"Yeah, right, must be a scam!"... ...but like most of us I was

curious. So, I kept reading.

It said you send $1 to each of the 5 names and addresses stated in

the article. You then place your own name and address in the

article at the bottom of the list at #5, and post the article in at least

200 newsgroups (there are thousands). No catch, that was it!

So I thought it over, talked to a couple of people about the

whole thing. I figured what have I got to lose except for 5

stamps and $5? So, I tried it.

Well, guess what...within 7 days, I started getting money in

the mail! I was shocked! I figured it would end soon, and didn't

give it another thought. But the money kept coming IN, tripling in size and multiplying by 10-20 times the amount that I got the first week! In my first week I made a total of over $1,000!!!! In the third week, I had over $10,000 dollars, and it's still growing. This is my fourth week (Oct 28) and I've made about $42,000 TOTAL, and the money is still coming in.....

Let me tell you how this works and more importantly, WHY it works. Make sure you print a copy of this article NOW, so you can use the information from it, and begin making money.

The process is very simple, and it consists of 3 EASY steps:

STEP 1: Get 5 pieces of paper and write the following on each sheet of paper..."PLEASE PUT ME ON YOUR MAILING LIST." Fold each piece of paper in half. Take five $1 bills and place ONE in each piece of paper. Then put each piece of paper in to it's own envelope and seal it. You should now have 5 sealed envelopes , EACH containing a piece of paper AND a $1 bill inside the folded paper. Make sure the words ..."PLEASE PUT ME ON YOUR MAILING LIST." are written on each piece paper. By doing that, you are creating a service and it's PERFECTLY LEGAL.

Finally, mail 1 envelope to 1 of the following 5 addresses:

1. S. Shaw, 611 23rd St., Sacramento, CA 95816
2. G.Charters,5809 Hudson St., Vancouver, B.C. Canada V6M 2Z2
3. D.Miller, 26 Aristone Dr., Berlin, NJ 08009
4. B.Peale, 1619 Nth 5th St., Perkasie, PA 18944
5. D.Watson, 2430 W.Territorial Rd., Battle Creek, MI 49015

STEP 2: Now take the #1 name off the list that you see above, move the other 4 names up (5 becoming 4, 4 becoming 3, etc..) and put YOUR NAME as number 5 on the list.

STEP 3: Post your amended article (with you name at #5)
to at least 200 news groups (I think there are close to 18,000 of them). This is easy to do. You can either type out this message (altering any part you deem worthy, EXCEPT the name and addresses) with an ordinary editor or with your web browser's 'To:News' key at the upper left corner of this screen (Netscape Navigator 3.0). After typing this article, save a copy. Any time you want to post this article on a newsgroup, just use a flashy subject and post your saved copy. That's it, easy! Now, post the message to at least 200 DIFFERENT newsgroups. 200 IS THE MINIMUM. The more you post, the more money you will make. You are now in the mail order business and will start receiving your $1 envelopes from various people all over the world within days.
HINT: THE MORE NEWSGROUPS YOU POST TO, THE MORE MONEY YOU WILL MAKE. You may even want to rent a PO Box, eventually because of all the mail. If you wish to stay anonymous, you can come up with a name, such as "manager" or "investor." Please be sure to check that all the addresses on the envelopes are correct.

.
LET ME TELL YOU WHY THIS SYSTEM WORKS!!!
Out of every 200 postings, let's say I ONLY receive 5 replies, which is actually VERY LOW. So I made 5 dollars with my #5. Now then, each person who just sent me $1 makes, say only 200 POSTINGS, now with your name at number 4, WHICH IS A TOTAL OF 1000 POSTINGS, not including yours too. 50 people send you $1 now; that's $50 you just made! Now, then your new 50 agents post 200 each with YOUR NAME AT NUMBER 3, OR 10,000 POSTING (50x200). Average return is 500 at $1 each is $500. They make 200 postings, which is 5,000 returns at $1 each, which

is $5,000 dollars! And finally, 5000 people make 200 postings
each with YOUR NAME AT NUMBER 1. YOU NOW GET A
RETURN OF $50,000 BEFORE YOUR NAME DROPS OFF
THE LIST. AND THAT'S IF EVERYONE MAKES 200 POSTINGS
ONLY, AND IF ONLY 5 PERSONS RESPOND!!!!!
When your name is no longer on the list, you just take the
latest posting that is appearing in the newsgroups, and SEND OUT
ANOTHER $5 TO THE NAMES ON THE LIST, PUTTING YOUR
NAME AT 5 AGAIN. And start posting again. The thing to
remember is, do you realize that THOUSANDS OF PEOPLE ALL
OVER THE WORLD ARE JOINING THE INTERNET AND
READING THESE ARTICLES EVERY DAY, JUST LIKE YOU ARE
RIGHT NOW!!! So can you afford $5 dollars and see if it really
works? I think so....
People have said, "What if the plan is played out and no sends
the money?" So what! What are the chances of that happening
when there are TONS OF NEW HONEST USERS AND NEW
HONEST PEOLE who are joining the Internet and newsgroups
everyday and are willing to give it a try?
Estimates are at 20,000 to 50,000 new users, every day, with
THOUSANDS of those joining the actual Internet. Remember, play
FAIRLY and HONESTLY and this WILL WORK, I PROMISE YOU!!!
Honesty is the key, and the best policy. Make sure you print this
article out RIGHT NOW, also, try to keep an eye on the
newsgroups to make sure everyone is playing fairly.
REMEMBER, HONESTY IS THE BEST POLICY. YOU DON'T
NEED TO CHEAT THE BASIC IDEA TO MAKE MONEY!! GOOD
LUCK TO ALL AND PLEASE PLAY FAIRLY AND YOU WILL
REAP THE HUGE REWARDS FROM THIS, WHICH IS TONS OF
EXTRA CASH!!!
<< By the way, if you try to deceive people by posting the

messages with your name on the list and not sending the money to

the people already on the list, you'd be wasting your time.

I talked to someone who did that and only made $150 dollars, and

that was AFTER seven or eight weeks! He decided to send the 5

$1 bills, and in 4-5 weeks, he had over $10K. >>

THIS IS THE FAIREST AND MOST HONEST WAY I HAVE EVER SEEN TO SHARE THE WEALTH OF THE WORLD WITHOUT COSTING ANYTHING BUT OUR TIME!!

GOOD LUCK!

5699. Dedicated PBBS Radio

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-11-01 00:00:00 UTC
From: ks4aw@mail.dbtech.net
Message-ID: <55buro$t5e@dbtsvr2.dbtech.net>
Source record: 33845

Thanks in advance to all who read. A few hams and I in my area are interested in setting up a 2m PBBS. We are looking for different pieces/parts. The main part (the radio) is a difficult find. No one (including me) is willing to give up his/her radio for such a feat! At one time, I had read, on this newsgroup, a posting about a Motorola Micor (?) I believe. Can anyone verify this and, if so, tell me a good place to purchase one. We need a radio that has at least 50w out due to the remote location and the lack of packeteers in the area (we are trying to spark some interest).

Again, thanks for all replies and for reading this post...

Source record: 33846

I use a Radio Shack HTX 212 2m radio for packet on my KPC3.
I am wondering if it is possible to connect both the KPC3 & the Mic to the same jack via Y-connector and have both work.
I don't mean using both at the same time.
I mean if I can use either the TNC at one time, and then using the Mic for Voice at a different time without having to pull out the mic/tnc cable and connect the other.
Will something electrically not work?
Please post here or email your response.
Thanks

Why does a HOBBY have to be superior to commercial leading edge
technology. Lots of people like steam locamotives, which are far inferior
to the TGV, but so what. Morse code is inferior to wireless ethernet, but
so what.

>This was the drawing card that started it all and its the one that is
>lacking now.

So what. Then was then; now is now.

> Without it, we are pushing a covered wagon along a freeway
>and the traffic is going to run us over. We can only keep what we have
>if we invest in things better than what we own.

If you want to play with the best toys, get a job at a commercial wireless
company, or a telecomunications firm. I hear GI is hiring.

I'm happy playing in my covered wagon. I stick to the back roads. Nobody
is going to run me over. I pull over when the packets zoom by.

IMHO, they should reduce all the bands to 50 Kc CW-only allocations.

===

Q: What do you call an isolated island with lots of high-tech gizmos and

These guys asked for what they got. The program was overpriced,
support was pathetic, upgrades were WAY overpriced, and attitude was
arrogant. The only good thing about NetRom was the excellent manual.

And yes, I bought a NetRom chip for our first node. You couldn't even
change the callsign without paying for a new chip. No discount for
multiple nodes, etc.

If they'd have offered realistic pricing and regular upgrades, they'd
probably have done a lot better.

Such fears also ignore the fact that if there aren't enough hams, our hobby
will die out. Our clout with the government, so necessary to retention of all
our bands, is directly a function of the number of active, give-a-darn hams.
HF is still the best way to attract new hams.

<SNIP>

Let me see the old technology
1) 10 Ghz WAN, using TCP/IP at 10mbs. Carring HTTP, NNTP. SMTP.
2) UHF Linked Radio Networks covering thousands of square miles.
3) 1200 Mhz 2400 bps Digital Voice Radios.
4) Mobile Satellite SSB Voice Communications.
5) Mobile FM Video Communiucations.

Some of this technology I am installing as the next wave in personal
communications for John Doe Consumer. But I am using it now.
Perhaps if you would take some time and investigate more than the
local 2m FM party line repeater you wold find that out their on the
edge of Ham Radio is where all the new technology is, and it is being
devloped by hams.

One norwegian ISP promises a service in near future: transfer subscriber -->
ISP: by phone; ISP --> subscriber: by satellite (TV-equipment with some
add-on). Since the transfer volume subscriber --> ISP usually is small but the
other direction much higher, this could become a solution for remote/boat
internet access. The TV-satellite connection for a boat is on the market I
think, though quite expensive.

In response to what Jerry wrote (see below)

The MIC line has some DC present, to power the mic element. That DC voltage is also biased downward by the PTT to cause the handheld to transmit. The external mic may be wired to avoid presenting a voltage to the mic element unless you push the PTT on the mic, in which case, the audio from the mic may not be mixed with the TNC audio, but I don't have that particular handheld, and speaker mic, so don't know how they have it wired.

Ideally, they would have put in a mic switch with two poles, one to close the PTT line, and the other to put the MIC audio into the radio. Some of the mics with touchtone pads on them disable the mic audio when the tones are being sent, more clever engineering to keep voice audio from interfering with signalling audio.

You might consider building a small project box with a dpdt switch, with two inputs, tnc and mic, and use the toggle switch to flip between the mic and tnc. I built one of these toggle switch boxes a few years ago, and used it until I decided to leave a tnc on the air all the time, and got a second radio for voice. You may find that changing frequencies (between voice repeater and packet radio freq) is more of a hassle than it's worth, and each time you switch to the repeater, you disappear from the packet frequency, so if you have friends who might leave you messages in your TNC, your station will be intermittantly accessible.

Basically, the Y-adapter sounds questionable, but some other users may have done it with good results. Maybe they will post a message explaining how they wired the Y-adapter, and whether or not it works as they expected it to work.

As a licensed amateur, it is your responsibility to experiment, and to advance the communication art, so on that basis, you should try this, an report your results to the rest of us. Just kidding...

Have fun!!!

Jeff, WA4EGT

Jerry's original message:

"I use a Radio Shack HTX 212 2m radio for packet on my KPC3. I am wondering if it is possible to connect both the KPC3 & the Mic to the same jack via Y-connector and have both work. I don't mean using both at the same time. I mean if I can use either the TNC at one time, and then using the Mic for Voice at a different time without having to

My only negative comments are:

1) No pricing information. Why not? When customers go to the trouble of finding a website, the pricing should already be there. Why not put it there???

2) Why not allow customers to purchase from the website? Many people are not as hung up on security as others. Besides, netscape 3.0 is secure enough for most people.

Lot's of postives. Nice products (the 'best' of course!)

From: wb9mjn@wb9mjn.ampr.ORG
Message-ID: <11320@wb9mjn.ampr.org>
Source record: 33865

Hi,

I really don t see that Hams need to develope better technology. We ve been doing just fine, at least in the last ten years, with developement.

The problem is that the majority of hams are no longer PIONEERS. And as long as the that is the case, the PIONEERS will be outcasts, in a service that was created primarily for the PIONEERS.

This is the case now, and its the main reason why the general ham population does not use all this neet stuff we PIONEERS have come up with.

The 440 Repeater situation in the Chicagoland repeater is an example of this, . As many note, the bands are FULL, yet there is hardly any activity. Why, because somebody put a repeater on a pair, that nobody really needed. It was an ego thing, not a pioneering thing. They bought the stuff, and hooked it together, and it made them feel good. They didn t build the first repeater. And so, there it sits, wasting spectrum-time-area. And, in the meantime, we don t have 9600 baud web surfing going on by the people in ham radio who want it. So they leave ham radio. Pioneers are outcasts, and outcasted.

We need to give Pioneers the status, and resources they once had in Ham Radio. Without it, there really is no reason for Ham Radio. And we might as well all just be using HF(ALE), VHF, UHF and SHF Cellular Phones.

Ben,
From the PTT out of the TNC cable, hook a 2.2K resistor to the tip of
the mic plug... From the Xmit pin of the TNC, hook a .1uf cap to the tip
of the mic plug. <ake sure the shell of the mic plug conects to ground
on the TNC and it should work just fine.

> And in the TNC itself there is a jumper for HT's should it be in HT
> mode or normal?

Not sure what the jumper does... it may insert the 2.2K resistance
internally...

Take care,
Dave

You may wnat to look for some GE MVP rigs..they can handle almost any
abuse and keep right on going..and they are also pretty cheap to get a
hold of..

No doubt about it, Kermit is the best software to use for *any* serial
device! :-)

But seriously, "It all depends on what you want to do." No software does
more on packet than JNOS or TNOS, unless you count Linux with native
AX.25 in the kernel. But is that what you want to do?

Seriously, I used Kermit on DOS and Unix systems, but mostly VersaTerm
PRO on Macintosh for about 10 years. Has mostly to do with the fact I
used those programs for many many other things at the same time and
couldn't see any other reason not to use 'em for packet.

Now most of my packeting is running FreeBSD (Un*x) hosting TNOS.

I am looking for the pinouts for the two chips. The Icom CT-17 uses the standard MAX232 chip and the chip I have is the MAX232CPE. The are slightly differant but both work in the interface. I just need to know what the differant pins are so I can brew my own!!

For me, weekends are easy. When I am boating (closer to land than most)
I hook up via cellular modem connected to a flip phone. My weekends are
free. My problem comes when I ignore the fish and let 'em get away
'cause I'm hooked on the net. Or let the saltwater get on the phone,
I'm still bonking myself in the head for that one.

5727. IP number in Texas

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-11-03 00:00:00 UTC
From: root@paradox.nol.net

The Garmin 45/45XL or GPS-II have external antennas that can be replaces with an antenna that can be remoted such as the Trimble OEM miniature antenna with built in pre-amp. I routinely get 8 satellites at near full scale with this setup. The best thing about the Garmin vs. Magellan is that the Garmin has upload and download capability. You can download the track file from the Garmin and plot it on a map such as DeLorme's Street Atlas USA v3.0. The GPS-II has the ability to mount to the car's dash, or they have hardware to mount to a bicycle's handle bars and can be mounted vertical or horizontal.
For shareware and GPS info check out
ftp://sundae.triumf.ca/pub/peter/index.html.

Source record: 33875
Cross-posted to: rec.radio.amateur.digital.misc,triangle.radio

Packet>East
North Carolina Packet Systems List
Sorted by Frequency
11/2/96

System operators only: please send updates/corrections to
Gary Pearce KN4AQ @ KN4AQ.#RTP.NC
kn4aq.gary@mms.net

NOTE CHANGES IN "TYPE" COLUMN: I've tried to bring some
consistancy to the "Type" of systems listed, by narrowing
the definitions. I'm open to corrections where I guessed
wrong, and to alternative "types."

Here's how to decode the "Type" column:

LAN = Local Area Network - basic user access node that
permits forwarding, probably connected to a BBS.
DXLAN = Technically just a LAN, but dedicated to forwarding
to a DX PacketCluster.
SEDAN LAN = Another Local Area Network, dedicated to the
SEDAN keyboard-to-keyboard network.
NOS LAN = A LAN dedicated to TCP/IP networking.
BBS = Full Service Bulletin Board, accessed directly on
the listed frequency.
DXPC = DX PacketCluster, accessed directly on the listed
frequency.
Backbone = used for forwarding traffic between LANs, BBSs,
DX PacketClusters, etc. Generally, users are
requested to not use the backbone nodes directly.

5730. Best shareware software for TNC?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-11-03 00:00:00 UTC
From: "David A. Cooley" <cooldave@ipass.net>
Message-ID: <327D18ED.6B57@ipass.net>
Source record: 33876
Cross-posted to: rec.ham-radio.packet,rec.radio.amateur.digital,rec.radio.amateur.digital.misc

What is the best software (Shareware) to use with a TNC... I'm using an AEA PK-90... right now I have winpacket 5.4, but not sure if there is something better and/or newer.
Thanks,
Dave

Packet>East
North Carolina Packet Systems List
Sorted by City
11/2/96

System operators only: please send updates/corrections to:

Gary Pearce KN4AQ @ KN4AQ.#RTP.NC
kn4aq.gary@mms.net

NOTE CHANGES IN "TYPE" COLUMN: I've tried to bring some consistancy to the "Type" of systems listed, by narrowing the definitions. I'm open to corrections where I guessed wrong, and to alternative "types."

Here's how to decode the "Type" column:

LAN = Local Area Network - basic user access node that permits forwarding, probably connected to a BBS.
DXLAN = Technically just a LAN, but dedicated to forwarding to a DX PacketCluster.
SEDAN LAN = Another Local Area Network, dedicated to the SEDAN keyboard-to-keyboard network.
NOS LAN = A LAN dedicated to TCP/IP networking.
BBS = Full Service Bulletin Board, accessed directly on the listed frequency.
DXPC = DX PacketCluster, accessed directly on the listed frequency.
Backbone = used for forwarding traffic between LANs, BBSs, DX PacketClusters, etc. Generally, users are requested to not use the backbone nodes directly.

Excuse me, 'wide open space' on 222 MHz? Then why did the last 220 SMA meeting feature a hearing due to a denial of freq. coordination to a repeater on Blue Ridge, and why were there 2 freq. coordinators on 222 MHz in So. Cal. for a while? The 222 MHz band may not be used as much as 2 meters, but it's stuffed full of repeaters. There is some room on 6m, but it's awfully noisy.

I'm not sure we can blame Mike for the mess on 446.65. He is only a pawn of SCRRBA, which apparently decided that the frequency shall not have an 'open' repeater on it. The 'warning' transmitter cites references to SCRRBA coordination, but makes no mention of possible coordination of KJ6TQ by other freq. coordination entities, so it is not accurate to say that any other repeater on the freq. is uncoordinated.

Hello,

I'm interested by the relation between Internet and packet radio. Can you
give me some reference for learning about that ?

I'm a novice with packet (but not with networks nor radio nor data
processing).

I'm searching for contacts, especialy, but not only, with french people.

Some questions :
are there some packet networks in france ?
Is there a connection between internet and thoses network ?
Is there a distribution list for packet ?
What are the essential books or online documents to read for
understand 'state of the art'
.... etc.

Thanks.

Jerry,

A small audio switchbox is the safest way to go.

If you don't want to do the wiring yourself, then there are two commercial sources for such a box: MFJ has a line of switchboxes that are rig and TNC-specific. Check with them, or with one of their distributors, to see if the 212 & KPC3 are covered. An alternative is the Ultracable from Oak Bay, which lets you create any mic/rig/tnc wiring combination using jumpers (or so their documentation says).

Good luck & 73,

Rich

5752. PCjr on Packet?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-11-04 00:00:00 UTC
From: kevin@visi.com
Message-ID: <55ldvq$t12@darla.visi.com>
Source record: 33894

I have an old IBM PCjr that I would like to dedicate to a packet setup.

Does anyone use a PCjr on packet? If so, do you know where I can find a serial cable for it.

Any advise would help.

Thanks

kevin@visi.com

5753. "Invalid pointer" in JNOS - HELP !!!!

>
>This puts the msg into the tcpip area, the ww.tcpip newsgroup, and also
>into the tofbb area. The message-id is compared against the bid history
>(to be accepted into the 2 areas) and the news history files (for the newsgroup
>to accept it).

Okey - I tried this (but didn't include the area "tcpip") - but it
does not work fully - I will get a warning-message:
"free: WARNING! invalid pointer (8C9C:0008) pc = 5233:0292 proc
killer"
I wonder what that means.... I have even tried version 1.11x4.....
Here's a screen dump:

```
------------------------------------------------------------------------------
23:13 09472/074672
BBS:
0 Command:
jnos> FBB Forwarding started.
mbox: fwd started
Processing area tofbb. LastMsgidRead=1447: begin at 0 of 0.
New mail in newsgroup ww.tcpip
from <n1uoc%n1uoc.#ncok.ok.usa.na@sm7uge.ampr.org> at Fri Nov 01
23:12:34 1996
mbox: fwd started
fwd: sm7uge - checking for messages
New mail for tofbb from <n1uoc%n1uoc.#ncok.ok.usa.na@sm7uge.ampr.org>
New mail for tofbb from <n1uoc%n1uoc.#ncok.ok.usa.na@sm7uge.ampr.org>
free: WARNING! invalid pointer (8B9B:0008) pc = 5233:0292 proc killer

------------------------------------------------------------------------------
```

From the FBB-BBS I am forwarding that bulletin tcpip@ww from N1UOC.
Why is it
"new mail" twice in tofbb? Have the error something to do with that?

Here's a few files:

```
--------------------------------------------------------------------------------
REWRITE -> tcpip@ww tcpipww
--------------------------------------------------------------------------------
ALIAS -> tcpipww tofbb !ww!tcpip
--------------------------------------------------------------------------------
MAIL.LOG: (too long lines to cut out...) Here we can see the delivery
twice
```

Fri Nov 01 23:12:32 1996 queue job 1451 To: tcpip@ww From:
n1uoc%n1uoc.#ncok.ok
Fri Nov 01 23:13:45 1996 deliver: To: tofbb From:
n1uoc%n1uoc.#ncok.ok.usa.na@s
Fri Nov 01 23:13:45 1996 deliver: To: tofbb From:
n1uoc%n1uoc.#ncok.ok.usa.na@s

C:\JNOS\SPOOL\NEWS\ACTIVE -> ww.tcpip 00019 19 y
<- note! It does not increase second "19"
to "20" !

C:\JNOS\SPOOL\NEWS\GATEWAY -> ww.tcpip tcpip@ww

C:\JNOS\SPOOL\NEWS\TCPIP.WW\19 <- Here we have the bulletin as a file

---

C:\JNOS\SPOOL\HISTORY -> 03171_n1uoc 846886425

C:\JNOS\SPOOL\NEWS\HISTORY -> <03171_n1uoc> 961101 231234 ww.tcpip/19

```
After this JNOS thinks there is something to forward, and will make
connects to FBB - but there is nothing forwarded....

Any help...

Source record: 33762

Hello,

I'm interested by the relation between Internet and packet radio. Can you
give me some reference for learning about that ?

I'm a novice with packet (but not with networks nor radio nor data
processing).

I'm searching for contacts, especialy, but not only, with french people.

Some interrogations :
are there some packet networks in france ?
Is there a connection between internet and thoses network ?
Is there a distribution list for packet ?
What are the essential books or online documents to read for
understand 'state of the art'
.... etc.

Thanks.

5768. TNC Interfacing to ADI 2M and 70cm Radios

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-11-05 00:00:00 UTC
From: Gabe Nemeth <gabe@bnr.ca>
Message-ID: <327F46EF.25A9@bnr.ca>
Source record: 33764

Hi and thanks for reading.
Has anyone interfaced the ADI 2M/70cm radios directly
to a 9.6Kbps TNC?. I am interested in finding out because
the ADI represents great value here in CANADA for the $$.
(Best current price is 349.00 CDN, thats about 249 USD).

Or in general. I can read schematics. So, are there general
instructions on tapping radios directly, for TNC interfacing?
It would be nice to tap the radios without adding too much
additional load to the radio circuits themselves. Has anyone
any experience in this area? What kind of coupling is recommended?

Cheers, and '73 de VE3SLJ.
Gabe.

Hello ALL

I have moved my Winpack web page to a new location. It previously resided at Healey communications and it is now on Acay.

ALL files are operational including force17.zip !! I have added a TPK page to cater for the unexpected demand in TPK addons.

As always, FEEDBACK is welcome ! Hopefully with the help of N0MTH, I'll be able to add a Winpack FAQ section. I am also considering adding a TSTHOST or/and WinTnc page if there is enough demand and there are enough addons available to make it worthwhile !

New page @ www.acay.com.au/~vk2yx

If anyone is experiencing problems getting to the welcome page, try www.acay.com.au/~vk2yx/welcome.html

If you DO have problems, please e-mail me so I can let my ISP know..

Radio has to be pretty much line of site, doesn't it? So if you moved
out of range of any earth station, then you'd be cut off. At my old
company I set up linux boxes onboard supertankers with UUCP connections
back to the office. This used Inmarsat A. Cheaper than telex, but still
expensive :-(

Our RO's used to chat to each other via radio each night if they could "see"
each other - they used to discuss Unix problems and solve them amongst
themselves without having to bother me :-)

>Jerry KE6UUX
>Email: jerry.wang@csun.edu
>Web: www.csun.edu/~hbcsc274"

Jerry, There is a neat digital switching solution to this, I expect the
best way to describe it in words is:-
Use a J-K flip flop in the latching mode, with resets coming in by diodes
from the PPT line such that we get logic of "either audio or data signal
can switch the state to gain output signal flow in the analog path".
The analog path can be switched by using say a 4066 I/C and the J-K FF q
and not q outputs go to the control pins of the individual channels of
audio.
I have looked at it from several logic states, and arrived at conclusion
it wouldn't allow switching to occur until the other channel had decayed
in signal levels. Hope this helps, 73 Winton at ZL3AO.

Only at VHF and above. HF signals can reflect from the upper
atmosphere and "skip" around the world. This works especially
well over ocean paths. OTOH, there isn't a great deal of bandwidth
at HF, and there's a lot of interference and fading, so data rates
are low. Also, the required antennas grow larger at the lower
frequencies, which could be an issue on a small boat.

Amateur radio operators have been using teletype and tacket over
HF for years. The equipment is relatively cheap. As the previous
poster said, the data rates aren't anything to get excited about,
but are still quite a bit greater than 0 <g>. You must be licensed
of course, and the Ham bands can't be used for commercial traffic.
But this is a viable solution for non-commercial use.

I leave in Eagle Rock and always used the MARS repeater using high
power mobile rig. Lately I can't even make a call. You people are the
ones who are suppose to go to 222 MHz because those people got their
first. I too got intimimated with that QST, gave a call to one of MARS
people, it's phony. I wouldn't even give a damn to SCARA or whoever in
that Santiago Peak group. Oh well, Mr. Dengler, KE6TZF is Sunset Ridge
Repeater group. You're one of those people jamming. I was wondering
may be you people are getting a lot high power RF's being radiated
right in your head like those guys at 147.435? If you've been using
MARS 446.650, would this mess will make you happy? I should say 73 but
don't which is appropriate this time. May be KJ6TQ would no better...

1200 baud PSK has been successfully run on 10 meters between
continents. The LEOS (low earth orbiting satelites) run at least 1200
baud, the other satelites can run higher.

OTOH, I can't remember liking a 1200 baud connection, even when 2400
baud was the best available (I was recently reminded of it with some
cellular modem tests). If the poster is serious, he'll need alot of
scripting and crontab work to get anything useful, on-line will suck.

: Thanks,
: Dave

I have been VERY happy with WinTNC. The only problem is that it does use
KISS mode so my built-in mailbox in my MFJ TNC becomes useless. Lately, I
have been using a GREAT program called PacketPET for Windows. It has a
TON of nicely integrated features, and uses the native mode of yout TNC.
I have been leaving my radio and TNC on 24 hours per day with my TNC
mailbox enabled, and it has been working great.

Of course, I just got a used spare 386 PS/2 PC onto which I'm installing
jNOS. As soon as that is set up to my liking, I'll switch to that as my
24 hour system.

Good luck!

p.s. I can't seem to get TNOS to work with my PS/2. I have loaded both
the most recent versions of the DPMI memory manager and the most recent
versions of tNOS, and my system locks with a "Stack Overflow" error. Back
to using old-reliable jNOS!

Anything less than 14.4 really sucks nowadays!

The original poster, being me, is serious, so tell me more. What's PSK? It uses LEOSs I suppose? Do you have to be licensed? Price? What type of equipment do you need? Can you connect to the internet (telnet and/or email)? What kind of scripting do you mean? Where to start?

Thanks,
Axel

Hello Nino,

Have you already tried AltaVista with a query 'dtmf NEAR soundblaster'? That gives 12 results.

http://altavista.digital.com/cgi-bin/query?pg=aq&what=web&fmt=.&q=dtmf+NEAR+soundblaster&r=&d0=&d1=

Good luck.

If all he needs/wants to do is download e-mail and usenet,
I don't see why not. I will admit that any graphical interface
would be pretty much a write-off, except maybe some web pages with
images turned off.

FWIW, Left to my own options, I'd load the Linux box into a healthy
laptop and take it with me. Let it run UUCP to get mail/news over HF.
<shrug> I never got into the WWW anyway. I'm writing this connected
(via PC PLUS) to a Un*x box. Shell access only. No SLIP, no PPP,
no graphical interface. It's fast, easy, and cheap (Hour/day for $5/month).
If I need the WWW, I can run Lynx (text-based browser) and guess at
the images, though mostly when I'm browsing I'm looking for something
technical. I never see the junk on Yahoo and other popular sites,
and usually get my info faster because I don't have to wait for an
image to download every screen.

Sorry, I digress...

5790. TS-690S Tx Audio Problem w/TNC

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-11-06 00:00:00 UTC
From: scott <acepilot@mwt.net>
Message-ID: <32819226.18D8@mwt.net>
Source record: 33786

Anybody experience the following with the Kenwood TS-690s (and I presume the 450S would be the same):

I connect my radio to my MFJ-1278 All Mode TNC via the ACC2 (13 pin) jack provided on the back of the rig. If I am using the TNC with the radio, everything seems to work peachy. If I leave the radio connected to the TNC and use the front panel Microphone connector for SSB, I get reports of distorted audio. If I disconnect the TNC Cable, audio reports are excellent. If anyone has come across this, AND A FIX, please let me in on it. I love the radio, but connecting and disconnecting the TNC all the time SUCKS! 73, Scott, N0EDV.

> Again, thanks for any help.
>

You can try paKet or SP. Paket will work with your existing firmware,
but uses separate screens for the different functions (chosen with the F
keys). SP requires WA8DED or TheFirmware eproms, or can be used wtih
the TNC in KISS mode by running the TFKISS TSR. PaKet and the freeware
version of SP are both available from ftp.tapr.org. WA8DED eproms are
available for purchase from TAPR. These are compatible with the TNC-2
and may also work with the Spirit-2 (ask Paccomm to be sure).
TheFirmware eprom images and TFKISS are available from a number of
places, use archie or a search engine and you will undoubtedly be able
to find them.

The TAPR TNC-2 code is generic (some versions require 16K of RAM, others require 32K). Code used in many clones or near clones (MFJ1270, PacComm Tiny-2, DRSI DPK-2, for example) is interchangeable. As far as I know, the only AEA unit which uses compatible code is the PK-80. The PK-88 and later use proprietary code by AEA. The PK-90 was not sold for amateur use and I don't have knowledge about that model. You can probably find out by contacting AEA.

You are both correct. It is far from optimal; it is still widely used
(at least in the U.S.A.) and many people (I hesitate to say most, but
Brian is probably correct) think it the best or only way to network.

There is a database at ftp.ucsd.edu in /hamradio/packet/ampr.org.
Entries will only show up there if you or someone else put them in.

You are on that list: 44.102.16.75

PMFJI, MFJ markets a tnc/mic switch for approx. 35US$ and has serveral models available based on type of radio/type of tnc. I just finished installing one between my Alinco DR150T 2m rig and Kantronics KPC-3 TNC. I had to add an external speaker (for the audio) but otherwise it works fine.

You need a null modem cable. I think you can get away with just a
ground and pin 2 one end to pin 3 the other and vice versa.

For parms you need to say what you are doing - a node, user, what? I
believe that NEDA has a web site with their recommendations posted.
Hopefully someone else can chime in or email me and I'll look it up
for you over the weekend when I'm home. (on the road now)

I hope this isn't a dumb question, but here goes...
I have an AEA PK-90 and I am wondering if the code in EPROM is generic
across all T.A.P.R. TNC-2 units, or if they are unit specific.
If they are generic, or if there is an upgrade for the pk-90 any
pointers and advice will be welcome.
Thanks,
Dave

5809. OS/2 PI card driver bug fix

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-11-07 00:00:00 UTC
From: daheath@ibm.net
Message-ID: <55t3iu$u84$1@news-s01.ny.us.ibm.net>
Source record: 33796

This is for those of you who are running the WA4DSY
OS/2 PI card driver with JNOS or PMNOS.

I have found and corrected a problem in PI2DRVR.SYS
which caused incoming packets to be discarded when
the transmitter had to defer because DCD was active.
When the transmitter wanted to send a packet while
the channel was busy the incoming packet got trashed.

You can get the fix at:

http://www.wa4dsy.radio.org

There's a link to the file pi2fix.zip on my home page. You can
also get the whole OS/2 PI card driver package if you want.

5811. Error Correction Coding for 56KB modems

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-11-07 00:00:00 UTC
From: daheath@ibm.net
Message-ID: <55t4onufo1@news-s01.ny.us.ibm.net>
Source record: 33798

WA4DSY/PacComm 56KB modem users who want to play with
Error Correction Coding AKA Forward Error Correction
can download a binary EPROM image from my home page
to replace the EPROM in your 56KB modem. The
replacement EPROM adds 1 parity bit for every 2 data
bits which reduces the maximum through-put to 37.3 KB.
However, the modem can operate with signal levels
3 db lower than the uncoded version and is
pretty much immune to impulse noise from sources such as
power line static and radar noise. Three stations
in the Atlanta GA area have been using this beta EPROM
for about a week with good results. Your mileage may vary.

But does any of that stuff beep? "Real" hams beep, shoot skip,
and work "DEE-X". "Real" hams have no use for stuff that they
can't copy by ear and send by hand. Any "real" ham will tell you
that developments only come from giant multinational corporations.

"Real" hams are too stupid to advance the art, assume everyone else
is too, and sneer at the idea of "snapping chips into sockets". If
it doesn't glow in the dark, or can't be scavenged from a 1950s TV
set, then it isn't fit for a "real" ham to touch. After all, some
third world person might not have it, and woe be unto us if we
don't drag our fellows down to the lowest common denominator.

Somehow, I don't think you're a "real" ham. Too bad there aren't
more like you in amateur radio.

From: krause@rd.itt-sc.de
Message-ID: <55vcsq$gm8@belchen.freinet.de>
Source record: 33713

hallo,

is there anybody who had (or will do) try the high speed modems from S53MV ?

Who dont know what I mean can lock at http://lois.kud-fp.si/hamradio/packet.html.
Its a very slow link but very intereting.

I am fascinate from this kind of idea. I meet S53MV in Sep at Weinheim. He has give a presentation of there new 1.2288 MB/s link on the HamRadio. They have build a compled new TX/RX with integrated PSK (os was is QPSK ??) modem. GREATH

Now I will spend some Time on test this kind of modems. I will start with the "Manchester Modem".

Had anybody try this bevor ????

Is there anybody who live in my near and we can try this together ??? I live in Freiburg. It is a town in south Germany.

73++ Joerg DG2GJK

I usually like reading your posts. You've got so much technical information to offer, even in support of other agendas, that i can count on learning something or at least about something.

This bunch of insults, however, just continues the internecine backbiting that does little to advance honest debate. Someone offers concrete examples to support his point and the response is invective and an offhand, "you're the exception" type of comment.

I don't know what a "real" ham is. Lots of people involved for reasons of their own. Some very smart, very technical, some, like me, non technical, but hoping to learn a bit abt the mysteries of electronics.

But there're always people ready to tear you down, to build themselves up. Has to be a better way to communicate, pun intended.

I'm not the thought, speech or any other kind of police. But look forward to reading more of your (intended or not) educational type posts...73 de John, ks4xn.

Hello, Folks:

I now have Packet Bulletin Export Files available on my Home Page.

The files are split by distribution group. I now have the following available: ALLUSA, WW, EU, CANADA, ARRL, AMSAT, and NASA, and many others. Others may be added as needed.

Files will be posted daily and should be online after about Noon Central Time.

Just point your Netscape 3.0 or MS Inetrnet Explorer 3.0 browser at:

http://www.trucom.com/ppages/marty

and go to the Amateur Radio area. The rest should be clear to all.

NOTE: New export files by distribution are being added almost daily! Many thanks to all who are sending me their BBS exprts via attached E-Mail for inclusion!

I have just today (17 OCT) updated the pages to include a Frames Version that makes navigation around the site easier. Note that the non-Frames Versions are still there but the URLs have changed.

Take Care & 73

Greetings all,

Thought I would throw in my $.02 worth. I had a spare 25 pin data
switch kicking around. I built the neccessary adaptor cables (one 25
pin male D plug to male 9 pin D plug for the KPC-3, one 25 pin male D
plug to female 8 pin DIN for the ICOM-28H and another cable with a
male connector on the end to plug the desk mike into). It worked out
pretty good, all I had to do was purchase the 8 pin connectors!

So there ya go....

5823. LBBS Help

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-11-09 00:00:00 UTC
From: Steve@deltabbs.demon.co.uk
Message-ID: <847545189snz@deltabbs.demon.co.uk>
Source record: 33719
Cross-posted to: uk.radio.amateur,rec.radio.amateur.packet,rec.radio.amateur.digital.misc

Hi all,

I run a mailbox using the fine LBBS 0.18B written by Darryl Miles and have been trying to contact him with a couple of problems, but he doesn't appear to be around anymore.

If anyone can give me his *current* email address, or, help me with the following points, I'd be appreciative.

1. There seems to be a problem with the bbs-inject program when some R-lines that include mixed alphanumeric fields. Notably, there are four Dutch stations along the lines of call@bbs.ZA2.NLD.EU where the 'ZA2' whatever causes the bbs-inject to stall, leaving a lock file behind. This happens everytime and means my spool directory grows and grows. Ihave to manually 'adjust' those lines, and it works again.

2. My forwarding partner has upgraded his system to NNA 3.01. Although our forwarding appears to be fine, I understand there is a potential problem, and that a new version of LBBS has a fix. This *could* be a fix for the suspect FBB Compressed Forwarding rather than specifically for NNA though.

Any clues?

Steve

5830. tnc2 - how to get in kiss mode?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-11-10 00:00:00 UTC
From: pberrett@tbsa.com.au
Message-ID: <564o00$tuu@news.tbsa.com.au>
Source record: 33726

Hi all

I wish to try out the wintnc software that has been recently released as well as try out a bit of tcpip.

The difficulty is that whilst tcpip etc is easy enough to get going on baycom style modems i have difficulties with my tnc.

I have an mfj1270b tnc-2.

I have looked through the manual and searched the internet to no avail. I know that there is a command 'kiss on' which is supposed to put the tnc into kiss mode however it seems to stay in command mode.

When I run the wintnc software it does not recognise any packets being received by the tnc. I have configured the software correctly to a kiss compatible tnc however unlike the baycom it does not recognise any packets.

When I run tpk I can still see packets coming up on the screen so they are coming ok. And the wintnc parameters seem to be correct with regards to speed of connection to tnc (9600) etc.

It seems the tnc is not kicking correctly intop kiss mode.

How can I tell my tnc to go into kiss mode. Is there some sort of initialisation string (there is a space for this in wintnc) that I can use to put it into kiss mode?

Hoping someone can help

cheers Peter vk3kat

5832. TAPR SS STA Granted

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-11-10 00:00:00 UTC
From: gjones@teachnet.edb.utexas.edu
Message-ID: <877660.ensmtp@teachnet.edb.utexas.edu>
Source record: 33728

TAPR's Spread Spectrum Special Temporary Authorization is Granted
November 8th, 1996

The FCC has granted a Special Temporary Authorization (STA) to Greg Jones, WD5IVD, and Dewayne Hendricks, WA8DZP, on behalf of TAPR (Tucson Amateur Packet Radio, Corp), regarding spread spectrum communications. On April 10th, 1996, TAPR requested a waiver of the rules and regulations governing Amateur Radio spread spectrum communications in order to conduct an experimental program to test spread spectrum emissions over amateur radio facilities on different bands.

Full details on the TAPR spread spectrum STA are available on its web page <http://www.tapr.org> under the Spread Spectrum area.

A Special Temporary Authorization (STA) is the authority granted to a permittee or licensee to permit the operation of a broadcast facility for a limited period at a specified variance from the terms of the station authorization or requirements of the FCC rules applicable to the particular class of station.

TAPR recently released a position statement on Spread Spectrum Technology Development which in part states, "TAPR believes that the technical facts support our conviction that conventional and spread spectrum systems can coexist without detriment to conventional systems on all frequencies from MF to EHF. To this end, TAPR will begin to research spread spectrum systems that will develop technology for future deployment." (<http://www.tapr.org/ss/>)

TAPR plans to continue its leading role in developing standards and technology for spread spectrum communications for the amateur radio community through discussion groups, cooperative efforts and experimental programs such as now being permitted by the recently granted STA. In particular, due to the rapid development of communications hardware and software, TAPR believes that the use of hybrid spread spectrum emissions, as well as spreading codes not envisioned by Section 97.311(d) of the Rules can be employed without causing harmful interference to other amateur radio operators.

TAPR was founded in 1982 as an international organization with interests in the areas of packet and digital communications. Today, TAPR continues as a membership supported nonprofit amateur radio research and development organization, and currently has more than 2,000 members worldwide. TAPR continues to develop kits for the amateur radio community and is working actively on publications and communications standards.

You might have to give it the command to go to KISS mode and then do a soft reset. That's how my KAM Plus does it, though the manual didn't explain it that way.

I had the same problem with my MFJ-1270B. It turns out that you need
version 1.1.8 or newer to have the KISS support. You can download it
from http://www.tapr.org/ in the Software Library and burn the EPROM
yourself, or order a V1.1.9 EPROM from TAPR at 817-383-0000.

There is also a KISS-only EPROM for the TNC2.

In addition to "kiss on" you need to issue the command "restart".
Three LEDs shoulc blink three times, indicating that it is in KISS mode.

Some of the versions of MFJ (and TAPR) firmware have a potential problem
that if you have set up anything other than the default KISS parameters,
they will reset to the defaults after a few minutes of no signals being
received. Replacements are available from TAPR (1.1.9 eproms or if you
can burn your own, 1.1.8a is freely available for download from
www.tapr.org or ftp.tapr.org.) Or you can use a dedicated KISS eprom,
if you only use software that requires KISS. These are also available
from TAPR.

If you just use the defaults, your current firmware should work.

Bob

The problem is a latent defect in the Kenwood radio design. Forget about working AFSK and go for a FSK hookup and you can get around the problem.

Been there, done that and it is waste of your time and effort to contact Kenwood. No problems in FSK...never could get AFSK to work and AEA does not even show a PK-232 AFSK hookup. They recommend FSK...and I learned why the hard way.

Normally, and I say normally, because I have a kpc-3, the tnc must be put into kiss mode with the INterface kiss command. If your tnc uses kiss on, then that's what should do it. However, after the tnc is put into kiss mode, it requires a reset. There should be a reset, or a restart command for the tnc. Try reset first, and if it doesn't work, resort to the manual. Look in the manual index for Kiss Mode, and/or wait for someone out here to reply who also has an MFj. 73.

5845. Copying RTTY with KAM + ?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1996-11-11 00:00:00 UTC
From: kn4aq.gary@mms.net
Message-ID: <567474$fd@ralph.vnet.net>

With the help of several hams on this newsgroup, I'm up and running with my KAM Plus and Icom 706, using KaWin software. My third RTTY contact was Japan, during the WAE-RTTY contest, from here in North Carolina.

HF digital is still something of a mystery (what frequencies, what modes, what bps rates, what tones, who's "live" and who's automated....?). I have some reading to do in the ARRL operating manual... any other good books or web sites to read? (I've found Gloria Medcalf's site - http://www.idir.net/~medcalf/ztx/).

But my most immediate question involves RTTY:

When in RTTY mode, listening to an "empty" frequency, the KAM's bargraph display is full of "noise," and my computer display is constantly printing "garbage" characters. Once I've tuned in a signal, I print the copy fine, but as soon as the signal drops the "garbage" returns.

In limited experimenting, I think I've found that if I'm NOT using HOST mode (if I connect to the KAM with just a standard communications program), this doesn't happen so much.

The manual doesn't show any software or hardware adjustments that I can find (probably right under my nose).

Any suggestions? Anybody want a sked?

73,
Gary

:>I have looked through the manual and searched the internet to no avail.

After giving the command "kiss on". send the command "restart". This will reset the TNC in kiss mode.

In the Kantronics installation it notes that input
level greater than 50mv should be padded. The basic answer is to reduce the
signal level to the TNC. It should not make any difference whether
the TNC is running in Host mode or command mode.
